A SYSTEM OF
GEOMETRY AND TRIGONOMETRY,
WITH A
TREATISE ON SURVEYING;
COMPRISING VARIOUS METHODS OF TAKING THE SURVEY OF A
FIELD, WITH DIRECTIONS FOR PROTRACTING
AND FINDING AREAS;

IN WHICH, ALSO, THE PRINCIPLES OF

RECTANGULAR SURVEYING,

BY WHICH AREAS MAY BE ACCURATELY CALCULATED WITHOUT
PLOTTING, ARE FULLY EXPLAINED:

WITH A COMPLETE SERIES OF

MATHEMATICAL TABLES,

AND THE NECESSARY EXPLANATIONS.

BY ABEL FLINT, A. M.

A NEW EDITION, ENLARGED,

WITH

PRACTICAL ILLUSTRATIONS ON SURVEYING,
INCLUDING OTHER BRANCHES CONNECTED THEREWITH; REMARKS
ON THE MODE OF DISTRIBUTING ESTATES; LOCATING
AND SURVEYING ROADS, &c.

FOR THE USE OF THE STUDENT AND PRACTICAL SURVEYOR.

BY GEORGE GILLET,
SURVEYOR GENERAL OF CONNECTICUT.

ALSO, A CONCISE
TREATISE ON LOGARITHMS,

BY F. A. P. BARNARD,
LATE TUTOR IN YALE COLLEGE.

SEVENTH EDITION.

HARTFORD,
PUBLISHED BY COOKE AND CO.

FOR SALE BY THE PRINCIPAL BOOKSELLERS IN THE U. STATES.

DISTRICT OF CONNECTICUT, ss.

BE IT REMEMBERED, That on the second day of August, in the L. S. fifty-fifth year of the Independence of the United States of America, Oliver D. Cooke, of the said District, hath deposited in this office the title of a book, the right whereof he claims as proprietor, in the words following, to wit: "A system of Geometry and Trigonometry, with a Treatise on Surveying; comprising various methods of taking the survey of a field, with directions for protracting and finding areas; in which, also, the principles of Rectangular Surveying, by which Areas may be accurately calculated without plotting, are fully explained: with a complete series of Mathematical Tables, and the necessary Explanations. By Abel Flint, A. M. With improvements by George Gillet, Surveyor General of Connecticut. Sixth edition, revised and enlarged, by the addition of copious notes and illustrations, and a concise Treatise on Logarithms, by Frederic A. P. Barnard, A. B., Instructor in Mathematics in the Hartford Grammar School, and author of a Treatise on Arithmetic." In conformity to the act of Congress of the United States, entitled, "An act for the encouragement of learning, by securing the copies of Maps, Charts, and Books, to the authors and proprietors of such copies, during the times therein mentioned." And also to the act entitled, "An act supplementary to an act, entitled, 'An act for the encouragement of learning, by securing the copies of Maps, Charts, and Books, to the authors and proprietors of such copies, during the times therein mentioned,'" and extending the benefits thereof to the arts of designing, engraving, and etching historical and other prints.

CHARLES A. INGERSOLL,

Clerk of the District of Connecticut.

A true copy of record, examined and sealed by me,

CHARLES A. INGERSOLL,

Clerk of the District of Connecticut.

Entered according to act of Congress, in the year 1833, by EDWARD P. COOKE, in the Clerk's Office of the District Court of Connecticut.

TO THE SEVENTH EDITION.

The original compiler of the following work designed, in preparing it, to furnish a plain and concise system of **PRACTICAL SURVEYING**.

That he did not fail of success, has been proved, by the high estimation in which this treatise has been, and is, at the present time, held by Surveyors, and by the continued and increasing demand for it. The publishers have used exertions to render the present edition more worthy of patronage.

About thirty pages of practical matter have been added by **GEORGE GILLET**, Esq., Surveyor General of the state of Connecticut. A distinguishing feature of the present as well as of the previous edition, is the introduction of a new and elegant set of tables, more extensive than those which have before been attached to this work, and on a superior type.—The numbers in the traverse table are carried to 100.

In the table of logarithms, and of logarithmic sines, &c., the decimals are carried to six figures, and a column of differences is added for the purpose of finding intermediate numbers.

When logarithms are carried to six places, they may be taken to as few, or as many within that limit, as is desired. Prefixed to the tables will be found a brief explanation of the nature and use of logarithms by Mr. **BARNARD**, which will be found a valuable addition.

The articles on distributing estates, locating and surveying roads, and on levelling, cannot fail of being highly useful.

Hartford, January, 1833.

The subscribers have examined in manuscript, the additions to the seventh edition of FLINT'S SURVEYING, by GEORGE GILLET, Esq., Surveyor General of Connecticut, and find them to embrace a system of correct, useful, and practical matter, judiciously arranged, and clearly explained to the understanding of the learner. Having long acted as Surveyors under public authority, we recommend this work as containing all the elementary science, and requisite tables, necessary or convenient for the learner, and the practitioner. The present is a more full and complete system than any former edition.

Connecticut, August, 1832.

PREFACE TO THE FIRST EDITION.

THE following work is chiefly a compilation from other Books ; and but very little new is added, except a more full explanation, than has yet been published, of RECTANGULAR SURVEYING, or the method of calculating the area of fields arithmetically, without drawing a plot of them and measuring with a scale and dividers, as has been the common practice ; and also a more particular explanation of the use of natural sines, than is contained in most mathematical books.

The compiler has endeavoured to render this work so easy and intelligible, that a learner will require but little assistance from an Instructor, except with regard to the construction and use of mathematical and surveying instruments. Before, however, he enters on the study of this book, he must be well acquainted with common Arithmetic, with decimal fractions, and the square root ; and he must also know the various characters or marks used in Arithmetic.

A surveyor will doubtless find many questions arise in the course of his practice, for the solution of which, no particular directions are here given ; nor is it possible to give directions for every case that may occur. In all practical sciences, much must be left to the judgment of the practitioner, who, if he is well acquainted with the general principles of his art, will readily learn to apply those principles to particular cases.

The primary design of this treatise is to teach common Field Surveying ; at the same time it contains the elements of Surveying upon a larger scale ; and the system of Geometry and Trigonometry with which it is introduced, with the problems for the mensuration of superficies, as also the mathematical tables at the end, will be found useful for many other purposes. It would be well, therefore, for those who do not intend to become practical surveyors, to acquaint themselves with what is here taught ; and with this view the following work is very proper to be introduced into academies and those higher schools which are designed to fit young men for active business in life. Indeed every person who frequently buys and sells land, should learn to calculate the contents of a field arithmetically ; a knowledge which may be acquired in a very little time, from the particular explanation here given of that method.

Notwithstanding the many books already published on the subjects here treated upon, it was thought a work of this kind was really wanted, and that if judiciously executed it would be useful. It is more particularly necessary at the present time in Connecticut, as the legislature of the State have lately enacted a law on the subject of surveying, in consequence of which more attention must be paid to the theory of that art than has been common.

These considerations induced the compiler to select from various publications what appeared to him important ; and to arrange the whole in a method best adapted, in his view, for teaching that useful art. How far he has succeeded in his endeavours to simplify the subject, and render it easy to the learner, must be submitted to the test of experience.

A GENERAL VIEW OF THE CONTENTS OF THIS WORK.

THE system of Geometry is divided into two parts. The first contains geometrical definitions respecting lines, angles, superficies, &c. The second part contains a number of geometrical problems necessary for Trigonometry and Surveying.

The system of Trigonometry is also divided into two parts : and teaches the solution of questions in right and oblique angled trigonometry, by logarithms, and also by natural sines.

The treatise on Surveying is divided into three parts. Part first treats of measuring land, and is divided into three sections. The first contains several problems respecting mensuration, and for finding the area of various right-lined figures and circles.

The second section teaches different methods of taking the Survey of fields ; also to protract them, and find their area in the manner commonly practised, and likewise by arithmetical and trigonometrical calculations, without measuring diagonals and perpendiculars with a scale and dividers ; interspersed with sundry useful rules and directions.

The third section is a particular explanation and demonstration of **RECTANGULAR SURVEYING**, or the method of computing the area of fields from the field notes, by mathematical tables, without the necessity of plotting the field. To this section is added a useful problem for ascertaining the true area of a field which has been measured by a chain too long or too short.

Part second treats of laying out land in various shapes.

Part third contains sundry problems and rules for dividing land, and determining the true course and distance of dividing lines, or from one part of a field to another. To this is added an appendix concerning the variation of the compass and attraction of the needle ; also, a rule to find the difference between the present variation, and that at a time when a tract was formerly surveyed, in order to trace or run out the original lines.

The mathematical tables, are a traverse table, or table of difference of latitude and departure, calculated for every degree and quarter of a degree, and for any distance up to 50 ; a table of natural sines calculated for every minute ; a table of logarithms comprised in four pages, yet sufficiently extensive for common use ; and a table of logarithmic or artificial sines, tangents, and secants, calculated for every 5 minutes of a degree. To these tables are prefixed particular explanations of the manner of using them.*

* This view of the contents was drawn up by Mr. Flint, and refers of course to the original edition.

GEOMETRY.

GEOMETRY is a Science which treats of the properties of magnitude.

PART I.

Geometrical Definitions.

1. A point is a small dot ; or, mathematically considered, is that which has no parts, being of itself indivisible.
2. A line has length but no breadth.
3. A superficies or surface, called also area, has length and breadth, but no thickness.
4. A solid has length, breadth, and thickness.
5. A right line is the shortest that can be drawn between two points.

Fig. 1.

6. The inclination of two lines meeting one another, or the opening between them, is called an angle. Thus at B. *Fig. 1.*, is an angle, formed by the meeting of the lines AB and BC.

Fig. 2.

7. If a right line CD. *Fig. 2.*, fall upon another right line AB, so as to incline to neither side, but make the angles on each side equal, then those angles are called right angles ; and the line CD is said to be perpendicular to the other line.

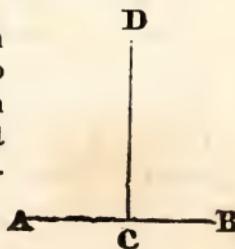

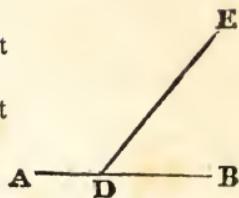

Fig. 3.

8. An obtuse angle is greater than a right angle ; as ADE. *Fig. 3.*

9. An acute angle is less than a right angle ; as EDB. *Fig. 3.*

NOTE. When three letters are used to express an angle, the middle letter denotes the angular point.

10. A circle is a round figure bounded by a single line, in every part equally distant from some point, which is called the centre. *Fig. 4.*

11. The circumference or periphery of a circle is the bounding line ; as ADEB. *Fig. 4.*

12. The radius of a circle is a line drawn from the centre to the circumference ; as CB. *Fig. 4.* Therefore all radii of the same circle are equal.

13. The diameter of a circle is a right line drawn from one side of the circumference to the other, passing through the centre ; and it divides the circle into two equal parts, called semicircles ; as AB or DE. *Fig. 5.*

14. The circumference of every circle is supposed to be divided into 360 equal parts, called degrees ; and each degree into 60 equal parts, called minutes ; and each minute into 60 equal parts, called seconds ; and these into thirds, &c.

Fig. 4.

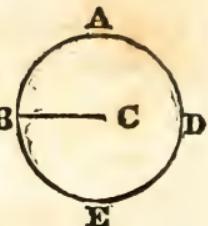

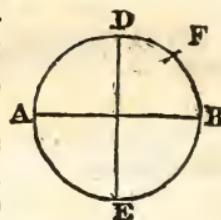

Fig. 5.

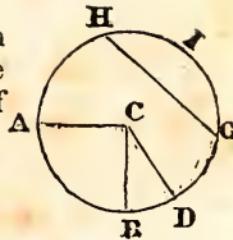

NOTE. Since all circles are divided into the same number of degrees, a degree is not to be accounted a quantity of any determinate length, as so many inches or feet, &c. but is always to be reckoned as being the 360th part of the circumference of any circle, without regarding the size of the circle.

15. An arc of a circle is any part of the circumference ; as BF or FD. *Fig. 5* ; and is said to be an arc of as many degrees as it contains 360th parts of the whole circle.

Fig. 6.

16. A chord is a right line drawn from one end of an arc to another, and is the measure of the arc ; as HG is the chord of the arc HIG. *Fig. 6.*

NOTE. The chord of an arc of 60 degrees is equal in length to the radius of the circle of which the arc is a part.

17. The segment of a circle is a part of a circle cut off by a chord ; thus the space comprehended between the arc HIG and the chord HG is called a segment. *Fig. 6.*

19. A sector of a circle is a space contained between two radii and an arc less than a semicircle ; as BCD or ACD. *Fig. 6.*

20. The sine of an arc is a line drawn from one end of the arc, perpendicular to the radius or diameter drawn through the other end : or, it is half the chord of double the arc ; thus HL is the sine of the arc HB. *Fig. 7.*

21. The sines on the same diameter increase in length till they come to the centre, and so become the radius, after which they diminish.—Hence, it is plain that the sine of 90 degrees is the greatest possible sine, and is equal to the radius.

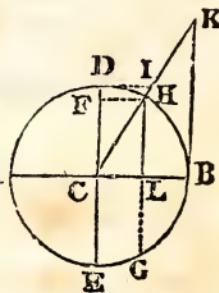

22. The versed sine of an arc is that part of the diameter or radius which is between the sine and the circumference ; thus LB is the versed sine of the arc HB. *Fig. 7.*

23. The tangent of an arc is a right line touching the circumference, and drawn perpendicular to the diameter ; and is terminated by a line drawn from the centre through the other end of the arc ; thus BK is the tangent of the arc BH. *Fig. 7.*

NOTE. The tangent of an arc of 45 degrees is equal in length to the radius of the circle of which the arc is a part.

24. The secant of an arc is a line drawn from the centre

Fig. 7.

through one end of the arc till it meets the tangent ; thus CK is the secant of the arc BH. *Fig. 7.*

25. The complement of an arc is what the arc wants of 90 degrees, or a quadrant : thus HD is the complement of the arc BH. *Fig. 7.*

26. The supplement of an arc is what the arc wants of 180 degrees, or a semicircle ; thus ADH is the supplement of the arc BH. *Fig. 7.*

[**NOTE.** It will be seen, by reference to *Fig. 7.*, that the sine of any arc is the same as that of its supplement. So likewise, the tangent and secant of any arc are used also for its supplement.]

27. The sine, tangent or secant of the complement of any arc is called the co-sine, co-tangent, or co-secant of the arc ; thus, FH is the sine, DI the tangent, and CI the secant of the arc DH ; or they are the co-sine, co-tangent, and co-secant of the arc BH. *Fig. 7.*

[The terms sine, tangent and secant, are abbreviated thus : sin. tan. and sec. So likewise, co-sine, co-tangent, and co-secant, are written co-sin. co-tan. and co-sec.]

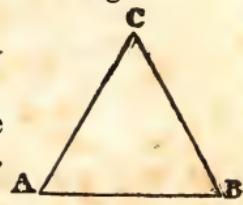

28. The measure of an angle is the arc of a circle contained between the two lines which form the angle, the angular point being the centre ; thus, the angle HCB. *Fig. 7.* is measured by the arc BH : and is said to contain as many degrees as the arc does.

NOTE. An angle is esteemed greater or less according to the opening of the lines which form it, or as the arc intercepted by those lines contains more or fewer degrees. Hence it may be observed, that the size of an angle does not depend at all upon the length of the including lines ; for all arcs described on the same point, and intercepted by the same right lines, contain exactly the same number of degrees, whether the radius be longer or shorter.

29. The sine, tangent, or secant of an arc is also the sine, tangent, or secant of the angle whose measure the arc is.

Fig. 8.

30. Parallel lines are such as are equal.  ly distant from each other ; as AB and CD. *Fig. 8.*

Fig. 9.

31. A triangle is a figure bounded by three lines; as ABC. *Fig. 9.*

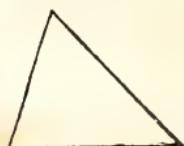

32. An equilateral triangle has its three sides equal in length to each other. *Fig. 9.*

Fig. 10.

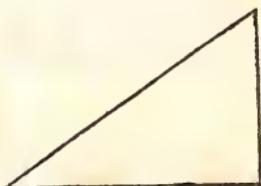

33. An isosceles triangle has two of its sides equal. *Fig. 10.*

*Fig. 11.*

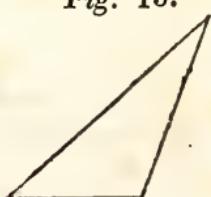

34. A scalene triangle has three unequal sides. *Fig. 11.*

*Fig. 12.*

35. A right angled triangle has one right angle. *Fig. 12.*

*Fig. 13.*

36. An obtuse angled triangle has one obtuse angle. *Fig. 13.*

37. An acute angled triangle has all its angles acute. *Fig. 9, or 10.*

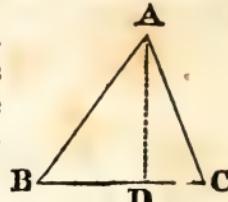

38. Acute and obtuse angled triangles, are called oblique angled triangles, or simply oblique triangles; in which the lower side is generally called the base, and the other two, legs.

39. In a right angled triangle the longest side is called the hypotenuse, and the other two, legs, or base and perpendicular.

NOTE. The three angles of every triangle being added together will amount to 180 degrees; consequently the two acute angles of a right angled triangle amount to 90 degrees, the right angle being also 90.

Fig. 14.

40. The perpendicular height of a triangle is a line drawn from one of the angles perpendicular to its opposite side; thus, the dotted line AD. *Fig. 14.* is the perpendicular height of the triangle ABC.

NOTE. This perpendicular may be drawn from either of the angles; and whether it falls within the triangle, or on one of the lines continued beyond the triangle, is immaterial.

Fig. 15.

41. A square is a figure bounded by four equal sides, and containing four right angles.

Fig. 15.

Fig. 16.

42. A parallelogram, or oblong square, is a figure bounded by four sides, the opposite ones being equal and the angles right.* *Fig. 16.*

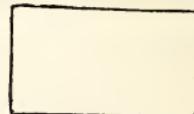

Fig. 17.

43. A rhombus is a figure bounded by four equal sides, but has its angles oblique.

Fig. 17.

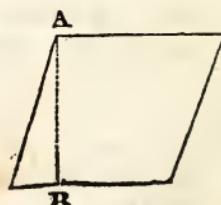

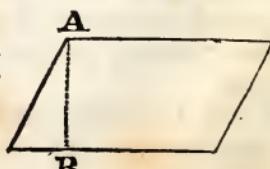

Fig. 18.

44. A rhomboid is a figure bounded by four sides, the opposite ones being equal, but the angles oblique. *Fig. 18.*

* Any four-sided figure, having its opposite sides parallel, is a parallelogram; but, in this book, the term is understood as it is here explained. Sometimes this figure is called a rectangle.

45. The perpendicular height of a rhombus or rhomboides, is a line drawn from one of the angles to its opposite side ; thus, the dotted lines AB. *figs. 17 and 18*, represent the perpendicular heights of those figures.

Fig. 19.

46. A trapezoid is a figure bounded by four sides, two of which are parallel though of unequal lengths. *Fig. 19* and *Fig. 20*.

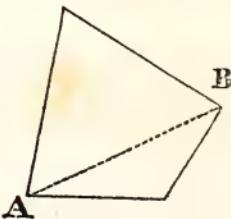

*Fig. 20.*

NOTE. *Fig. 19.* is sometimes called a right angled trapezium.

Fig. 21.

47. A trapezium is a figure bounded by four unequal sides. *Fig. 21.*

48. A diagonal is a line drawn between two opposite angles ; as the line AB. *Fig. 21.*

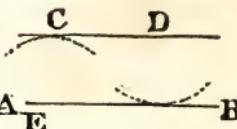

49. Figures which consist of more than four sides are called polygons ; if the sides are equal to each other they are called regular polygons, and are sometimes named from the number of their sides, as pentagon, or hexagon, a figure of five or six sides, &c. ; if the sides are unequal, they are called irregular polygons.

PART II.*Geometrical Problems.*

Fig. 22.

PROBLEM I. *To draw a line parallel to another line at any given distance; as at the point D, to make a line, parallel to the line AB. Fig. 22.*

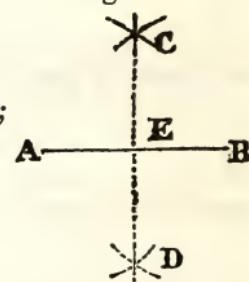

With the dividers take the nearest distance between the point D and the given line AB; with that distance set one foot of the dividers anywhere on the line AB, as at E, and draw the arc C; through the point D draw a line so as just to touch the top of the arc C.

A more convenient way to draw parallel lines is with a parallel rule. [The parallel rules, however, found in cases of mathematical instruments, are often inaccurate.]

Fig. 23.

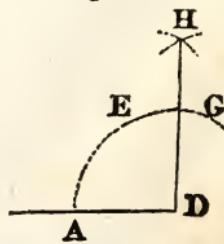

PROBLEM II. *To bisect a given line; or, to find the middle of it. Fig. 23.*

Open the dividers to any convenient distance, more than half the given line AB, and with one foot in A, describe an arc above and below the line, as at C and D; with the same distance, and one foot in B, describe arcs to cross the former; lay a rule from C to D, and where the rule crosses the line, as at E, will be the middle.

Fig. 24.

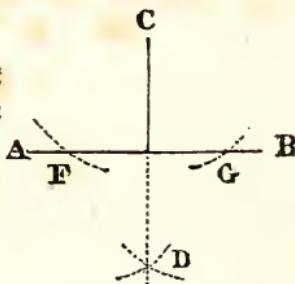

PROBLEM III. *To erect a perpendicular from the end, or any part of a given line. Fig. 24.*

Open the dividers to any convenient distance, as from D to A, and with one foot on the point D, from which the perpendicular is to be erected, describe an arc, as AEG; set off the same distance AD, from A to E, and from E to G; upon E and G describe two arcs to intersect each other at H; draw a line from H to D, and one line will be perpendicular to the other.

NOTE. There are other methods of erecting a perpendicular, but this is the most simple.

Fig. 25.

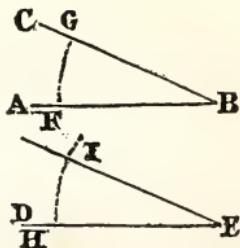

PROBLEM IV. *From a given point as at C, to drop a perpendicular on a given line AB. Fig. 25.*

With one foot of the dividers in C describe an arc to cut the given line in two places, as at F and G; upon F and G describe two arcs to intersect each other below the line as at D; lay a rule from C to D and draw a line from C to the given line.

Perpendiculars may be more readily raised and let fall, by a small square made of brass, ivory, or wood.

Fig. 26

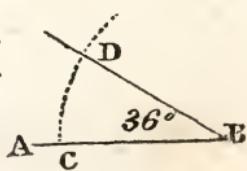

PROBLEM V. *To make an angle at E, equal to a given angle ABC. Fig. 26.*

Open the dividers to any convenient distance, and with one foot in B describe the arc FG; with the same distance and one foot in E, describe an arc from H; measure the arc FG, and lay off the same distance on the arc from H to I; draw a line through I to E, and the angles will be equal.

Fig. 27.

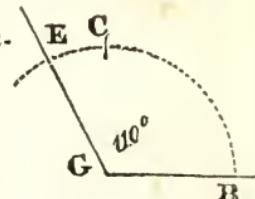

PROBLEM VI. *To make an acute angle equal to a given number of degrees, suppose 36. Fig. 27.*

Draw the line AB of any convenient length ; from a scale of chords take 60 degrees with the dividers, and with one foot in B describe an arc from the line AB ; from the same scale take the given number of degrees, 36, and lay it on the arc from C to D ; draw a line from B through D, and the angle at B will be an angle of 36 degrees.

Fig. 28.

PROBLEM VII. *To make an obtuse angle, suppose of 110 degrees. Fig. 28.*

Take a chord of 60 degrees as before, and describe an arc greater than a quadrant ; set off 90 degrees from B to C, and from C to E set off the excess above 90, which is 20 ; draw a line from G through E, and the angle will contain 110 degrees.

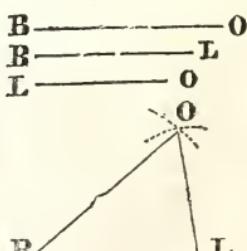

[It is best, however, in making obtuse angles, to take from the scale the chord of half the angle, and set it off twice. This will save taking two separate chords.]

NOTE. In a similar manner angles may be measured ; that is, with a chord of 60 degrees describe an arc on the angular point, and on a scale of chords measure the arc intercepted by the lines forming the angle.

A more convenient method of making and measuring angles is to use a protractor instead of a scale and dividers.

Fig. 29.

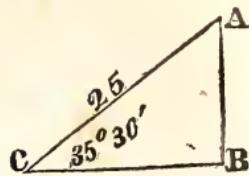

PROBLEM VIII. *To make a triangle of three given lines, as BO, BL, LO. Fig. 29, any two of which are greater than the third.*

Draw the line BL from B to L ; from B, with the length of the line BO, describe an arc as at O ; from L, with the length of the line LO, describe another arc to intersect the former ; from O draw the lines OB and OL, and BOL will be the triangle required.

Fig. 30.

PROBLEM IX. *To make a right angled triangle, the hypotenuse and angles being given. Fig. 30.*

Suppose the hypotenuse CA 25 rods or chains, the angle at C $35^{\circ} 30'$ and consequently the angle at A $54^{\circ} 30'$. See note after the 39th Geometrical Definition.

NOTE. When degrees and minutes are expressed, they are distinguished from each other by a small cipher at the right hand of the degrees, and a dash at the right hand of the minutes; thus $35^{\circ} 30'$ is 35 degrees and 30 minutes.

Draw the line CB an indefinite length; at C make an angle $35^{\circ} 30'$; through where that number of Degrees cuts the arc draw the line CA 25 rods, which must be taken from some scale of equal parts; drop a perpendicular from A to B, and the triangle will be completed.

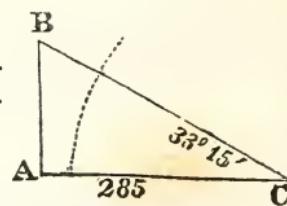

[A scale of equal parts may be found on one side of Gunter's scale, occupying half its length. It will be known by slanting lines which cross it at each end. The length of the scale, not occupied by these oblique lines, is equally divided into several larger divisions, numbered on one side, and likewise twice as many smaller, numbered on the other. In taking distances from the scale, each of these divisions, (either the larger or the smaller, as is most convenient,) must be considered 1, 10, 100, &c. rods, chains, or other dimensions of length. If each division be called 1, it will be easy to take off the required number. But the scale is not usually long enough for this. When each division is called 10, as many divisions must be taken, as there are tens in the given number. For the excess of tens, in this case, the little scale, with the oblique lines, is used. Each side of this little scale is divided into 10 equal parts, and each of these parts is, of course, 1. Then, to take off the hypotenuse, 25, above, we should take in the dividers 2 of the divisions of the large scale, and 5 of those of this small one. There is one of these little scales for the greater, and one for the smaller divisions of the large scale. When each division of the large scale is called 100, each of those of the small one becomes 10, and the units are found by means of the oblique lines. These are drawn across parallel lines, running the whole length of the scale, from each division on one side, to the next higher on

the other. The parallel lines divide the width of the scale into 10 equal parts. Since each oblique line, then, in crossing the scale passes over one division of length, it is evident, that, in passing one tenth across, (that is, to the first parallel line,) it will pass over one tenth of a division of length ; in passing two tenths across (that is, to the second parallel line,) it will pass over two tenths of a division of length, and so on. The parallel lines are numbered at the end of the scale. To take off a distance, containing hundreds, then, as 234, we must place one foot of the dividers on the second division of the larger scale, and on the parallel line marked 4, and extend the other foot to the third oblique line. Decimals may evidently be taken off in a similar manner ; the divisions of the larger scale being made units, and those of the smaller, tenths and hundredths.]

NOTE. The length of the two legs may be found by measuring them upon the same scale of equal parts from which the hypotenuse was taken.

Fig. 31.

PROBLEM X. *To make a right angled triangle, the angles and one leg being given.* Fig. 31.

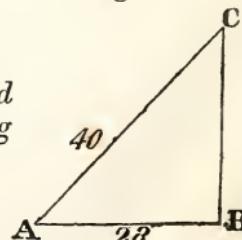

Suppose the angle at C $33^\circ 15'$, and the leg AC 285.

Draw the leg AC making it in length 285 ; at A erect a perpendicular an indefinite length ; at C make an angle of $33^\circ 15'$; through where that number of degrees cuts the arc, draw a line till it meets the perpendicular at B.

NOTE. If the given line CA should not be so long as the chord of 60° , it may be continued beyond A, for the purpose of making the angle.

Fig. 32.

PROBLEM XI. *To make a right angled triangle, the hypotenuse and one leg being given.* Fig. 32.

Suppose the hypotenuse AC 40, and the leg AB 28.

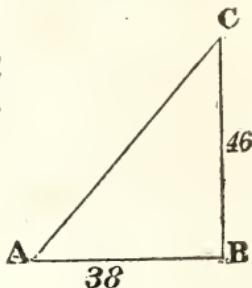

Draw the leg AB in length 28 ; from B erect a perpendic-

ular an indefinite length ; take 40 in the dividers, and setting one foot in A, wherever the other foot strikes the perpendicular will be the point C.

NOTE. When the triangle is constructed, the angles may be measured by a protractor, or by a scale of chords.

Fig. 33.

PROBLEM XII. *To make a right angled triangle, the two legs being given. Fig. 33.*

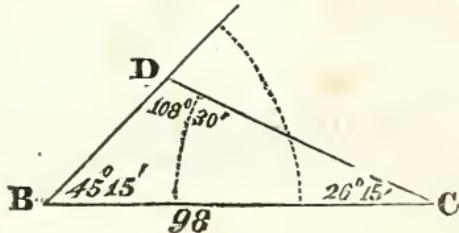

Suppose the leg AB 38, and the leg BC 46.

Draw the leg AB in length 38 ; from B erect a perpendicular to C in length 46 ; and draw a line from A to C.

Fig. 34.

PROBLEM XIII. *To make an oblique angled triangle, the angles and one side being given. Fig. 34.*

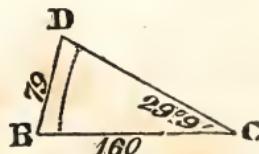

Suppose the side BC 98 ; the angle at B $45^{\circ} 15'$, the angle at D $108^{\circ} 30'$, consequently the other angle $26^{\circ} 15'$.

Draw the side BC in length 98 ; on the point B make an angle of $45^{\circ} 15'$; on the point C make an angle of $26^{\circ} 15'$, and draw the lines BD and CD.

Fig. 35.

PROBLEM XIV. *To make an oblique angled triangle, two sides and an angle opposite to one of them being given. Fig. 35.*

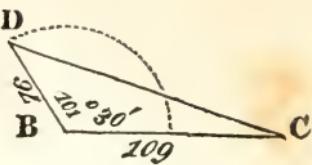

Suppose the side BC 160, the side BD 79, and the angle at C $29^{\circ} 9'$.

Draw the side BC in length 160 ; at C make an angle of $29^{\circ} 9'$, and draw an indefinite line through where the degrees cut the arc ; take 79 in the dividers, and with one foot in B lay the other on the line CD ; the point D will be the other angle of the triangle.

Fig. 36.

PROBLEM XV. *To make an oblique angled triangle, two sides and their contained angle being given.*

Fig. 36.

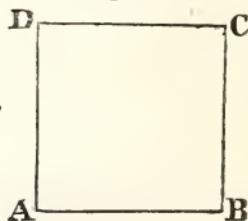

Suppose the side BC 109, the side BD 76, and the angle at B $101^{\circ} 30'$.

Draw the side BC in length 109; at B make an angle of $101^{\circ} 30'$, and draw the side BD in length 76; draw a line from D to C and it is done.

Fig. 37.

PROBLEM XVI. *To make a Square.*

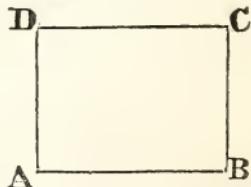

Fig. 37.

Draw the line AB the length of the proposed Square; from B erect a perpendicular to C and make it of the same length as AB; from A and C, with the same distance in the dividers, describe arcs intersecting each other at D, and draw the lines AD and DC.

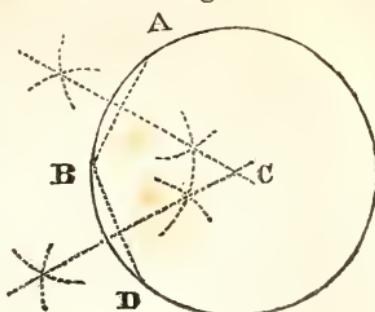

Fig. 38.

PROBLEM XVII. *To make a rectangle.* Fig. 38.

Draw the line AB equal to the longest side of the rectangle; on B erect a perpendicular the length of the shortest side to C; from C, with the longest side, and from A, with the shortest side, describe arcs intersecting each other at D, and draw the lines AD and CD.

Fig. 39.

PROBLEM XVIII. *To de-
scribe a circle which shall pass
through any three given points,
not lying in a right line, as A, B,
D. Fig. 39.*

Draw lines from A to B and from B to D; bisect those lines by PROBLEM II. and the point where the bisecting lines intersect each other, as at C, will be the centre of the circle.

PROBLEM XIX. *To find the centre of a circle.*

By the last PROBLEM it is plain, that if three points be any where taken in the given circle's periphery, the centre of the circle may be found as there taught.

Directions for constructing irregular figures of four or more sides may be found in the following treatise on SURVEYING.

TRIGONOMETRY.

TRIGONOMETRY is that part of practical GEOMETRY by which the sides and angles of triangles are measured; whereby three things being given, either all sides, or sides and angles, a fourth may be found; either by measuring with a scale and dividers, according to the PROBLEMS IN GEOMETRY, or more accurately by calculation with logarithms, or with natural sines.

TRIGONOMETRY is divided into two parts, rectangular and oblique-angular.

PART I.

RECTANGULAR TRIGONOMETRY.

This is founded on the following methods of applying a circle to a triangle.

Fig. 40.

PROPOSITION I. In every right angled triangle, as ABC, *Fig. 40*, it is plain from *Fig. 7*, compared with the Geometrical definitions to which that *Figure* refers, that if the hypotenuse AC be made radius, and with it an arc of a circle be described from each end, BC will be the sine of the angle at A, and AB the sine of the angle at C; that is, the legs will be sines of their opposite angles.

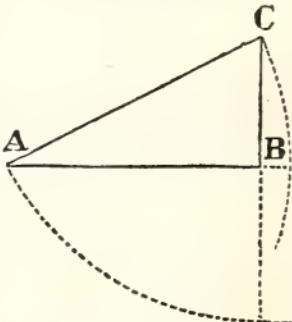

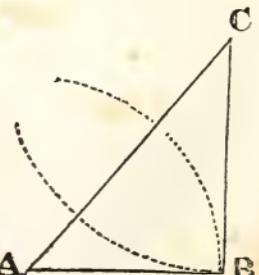

Fig. 41.

PROPOSITION II. If one leg, AB, *Fig. 41*, be made radius, and with it on the point A an arc be described, then BC, the other leg, will be the tangent, and AC the secant of the angle at A; and if BC be made radius, and an arc be described with it on the point C, then AB will be the tangent and AC the secant of the angle at C; that is, if one leg be made radius the other leg will be a tangent of its opposite angle, and the hypotenuse a secant of the same angle.

Thus, as different sides are made radius, the other sides acquire different names, which are either sines, tangents or secants.

As the sides and angles of triangles bear a certain proportion to each other, two sides and one angle, or one side and two angles being given, the other sides or angles may be found by instituting proportions, according to the following rules.

RULE I. To find a side, either of the sides may be made radius, then institute the following proportion :

As THE NAME OF THE SIDE GIVEN, (which will be either radius, sine, tangent or secant;) .

Is TO THE LENGTH OF THE SIDE GIVEN;

So IS THE NAME OF THE SIDE REQUIRED, (which also will be either radius, sine, tangent or secant;)

To THE LENGTH OF THE SIDE REQUIRED.

RULE II. To find an angle one of the given sides must be made radius, then institute the following proportion :

As THE LENGTH OF THE GIVEN SIDE MADE RADIUS ;

Is TO ITS NAME, (that is radius ;)

So IS THE LENGTH OF THE OTHER GIVEN SIDE ;

To ITS NAME, (which will be either sine, tangent or secant.)

Having instituted the proportion, look for the corresponding logarithms, in the logarithms of numbers for the length of the sides ; and in the table of artificial sines, and tangents, for the logarithmic sine, tangent or secant.

ADD TOGETHER THE LOGARITHMS OF THE SECOND AND THIRD TERMS, AND FROM THEIR SUM SUBTRACT THE LOGARITHM OF THE FIRST TERM : THE REMAINDER WILL BE THE LOGARITHM OF THE FOURTH TERM, WHICH SEEK IN THE TABLES, AND FIND ITS CORRESPONDING NUMBER, OR DEGREES AND MINUTES.

See the introduction to the table of logarithms ; which should be attentively studied by the learner before he proceeds any further.

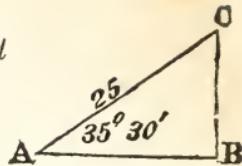

NOTE. The logarithm for radius is always 10, which is the logarithmic sine of 90° , and the logarithmic tangent of 45.

The preceding PROPOSITIONS and RULES being duly attended to, the solution of the following CASES of *Rectangular Trigonometry* will be easy.

CASE I.

Fig. 42.

The angles and hypotenuse given to find the legs. Fig. 42.

In the triangle ABC, given the hypotenuse AC 25 rods or chains ; the angle at A $35^{\circ} 30'$: and consequently the angle at C $54^{\circ} 30'$: (See note GEOM. Def. 39.) to find the legs.

Making the hypotenuse radius, the proportions will be ;

To find the leg AB.

$$\begin{array}{lcl} \text{As radius} & - & 10.000000 \\ : \text{hyp. AC, 25} & - & 1.397940 \\ : : \text{sine } \text{ACB}, 54^{\circ} 30' & - & 9.910686 \end{array}$$

To find the leg BC.

$$\begin{array}{lcl} \text{As radius} & - & 10.000000 \\ : \text{hyp. AC, 25} & - & 1.397940 \\ : : \text{sine } \text{CAB}, 35^{\circ} 30' & - & 9.763954 \end{array}$$

$$\begin{array}{c} 11.308626 \\ 10.000000 \end{array}$$

$$\begin{array}{c} 11.161894 \\ 10.000000 \end{array}$$

$$: \text{leg AB, 20.35 nearly}$$

$$\begin{array}{c} 1.308626 \\ \hline \end{array}$$

$$\begin{array}{c} : \text{leg BC, 14.52 nearly} \\ \hline \end{array}$$

$$\begin{array}{c} 1.161894 \\ \hline \end{array}$$

NOTE. When the first term is radius, it may be subtracted by cancelling the first figure of the sum of the other two terms.

Making the leg AB radius, the proportions will be :

To find the leg AB.

$$\begin{array}{lcl} \text{As secant CAB, } 35^{\circ} 30' & & \\ : \text{hyp. AC, 25} & & \\ : : \text{radius} & & \\ : \text{leg AB, 20.35} & & \end{array}$$

To find the leg BC.

$$\begin{array}{lcl} \text{As secant CAB, } 35^{\circ} 30' & & \\ : \text{hyp. AC, 25} & & \\ : : \text{tangent CAB, } 35^{\circ} 30' & & \\ : \text{leg BC, 14.52} & & \end{array}$$

Making the leg BC radius, the proportions will be :

To find the leg AB.

$$\begin{array}{lcl} \text{As secant ABC, } 54^{\circ} 30' & & \\ : \text{hyp. AC, 25} & & \\ : : \text{tangent ACB, } 54^{\circ} 30' & & \\ : \text{leg AB, 20.35} & & \end{array}$$

To find the leg BC.

$$\begin{array}{lcl} \text{As secant CAB, } 54^{\circ} 30' & & \\ : \text{hyp. AC, 25} & & \\ : : \text{radius} & & \\ : \text{leg BC, 14.52} & & \end{array}$$

The logarithms of the four last proportions being looked out, and added and subtracted according to the rule, the result will be found to be the same as in the two first proportions.

[The learner should exercise himself, in this and the following rules in TRIGONOMETRY, in stating all the proportions which can be made, until he is able to do it with facility.]

BY NATURAL SINES.

This CASE may be solved by natural sines,* according to the following proportions :

AS UNITY OR 1, IS TO THE LENGTH OF THE HYPOTHENUSE,
SO IS THE NATURAL SINE OF THE SMALLEST ANGLE, TO THE
LENGTH OF THE SHORTEST LEG. OR, SO IS THE NATURAL
SINE OF THE LARGEST ANGLE, TO THE LENGTH OF THE LONG-
EST LEG.

Or, which is the same thing, MULTIPLY THE NATURAL SINES
OF THE TWO ANGLES BY THE HYPOTHENUSE : THE PRODUCTS
WILL BE THE LENGTH OF THE TWO LEGS.

EXAMPLE.

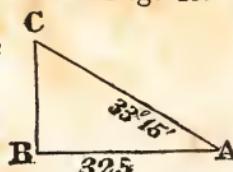

Nat. sine of $35^{\circ} 30'$		Nat. sine of $54^{\circ} 30'$
0.58070		0.81412
Hyp. 25		Hyp. 25
—————		—————
290350		407060
116140		162824
—————		—————
14.51750		20.35300
—————		—————
Leg BC 14.52		Leg AB 20.35

NOTE. The third decimal figure in the first product being 7, the preceding figure may be called one more than it is, viz. 2. And whenever in any product, &c. there are more places of decimals than you wish to work with, if the one at the right hand of the last which you wish to retain is more than 5, add a unit to the last, because a greater decimal number than 5 is more than half.

CASE II.

Fig. 43.

The angles and one leg given to find the hypotenuse and the other leg. Fig. 43.

In the triangle ABC, given the leg AB 325, the angle at A $33^{\circ} 15'$ and the angle at C $56^{\circ} 45'$: to find the hypotenuse and the leg BC.

* See the Introduction to the Table of Natural Sines.

Making the given leg radius, the proportions will be :

To find the hypothenuse.

As radius,	10.000000
: leg AB, 325	2.511883
:: sec. CAB, $33^{\circ} 15'$ *	10.077645
: hyp. 388.6	12.589528

To find the leg BC.

As radius,	10.000000
: leg AB, 325	2.511883
:: tan. CAB, $33^{\circ} 15'$	9.816658
: leg BC, 213.1	12.328541

NOTE. Reject the first figure, which is the same as subtracting radius, and seek the numbers corresponding to the other figures.

Making the leg BC radius, the proportions will be :

To find the hypothenuse.

As tang. ACB, $56^{\circ} 45'$
: leg AB, 325
:: sec. ACB, $56^{\circ} 45'$
: hyp. 388.6

To find the leg BC.

As tang. ACB, $56^{\circ} 45'$
: leg AB, 325
:: radius
: leg BC, 213.1

Making the hypothenuse radius, the proportions will be ;

To find the hypothenuse.

As sine BCA, $56^{\circ} 45'$
: leg AB, 325
:: radius
: hyp. 388.6

To find the leg BC.

As sine BCA, $56^{\circ} 45'$
: leg AB, 325
:: sine BAC, $33^{\circ} 15'$
: leg BC, 213.1

NOTE. If the leg BC had been given, instead of the leg AB, the proportions would have been the same, the obvious changes being made.

BY NATURAL SINES.

To solve this CASE by natural sines, institute the following proportions :

To find the hypothenuse. As THE NATURAL SINE OF THE ANGLE OPPOSITE THE GIVEN LEG, IS TO THE LENGTH OF THE LEG, SO IS UNITY OR 1, TO THE LENGTH OF THE HYPOTHE-NUSE.

Or which is the same thing, DIVIDE THE GIVEN LEG BY THE NATURAL SINE OF ITS OPPOSITE ANGLE, AND THE QUOTIENT WILL BE THE HYPOTHENUSE.

* Find the sec. as directed in the introduction to the tables, by subtracting the co-sine from 20.000 000.—ED.

To find the other leg. As THE NATURAL SINE OF THE ANGLE OPPOSITE THE GIVEN LEG, IS TO THE LENGTH OF THE GIVEN LEG, SO IS THE NATURAL SINE OF THE ANGLE OPPOSITE THE OTHER LEG, TO THE LENGTH OF THE OTHER LEG.

EXAMPLE.

Given leg 325. Nat. sine of $56^{\circ} 45'$, the angle opposite the given leg 0.83629. Nat. sine of $33^{\circ} 15'$, the angle opposite the other leg 0.54829.

As $0.83629 : 325 :: 1 : 388.6$.

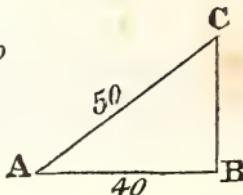

As $0.83629 : 325 :: 0.54829 : 213.07$.

CASE III.

Fig. 44.

The hypotenuse and one leg given to find the angles and the other leg. Fig. 44.

In the triangle ABC, given the hypotenuse AC 50 and the leg AB 40, to find the angles and leg BC.

Making the hypotenuse radius, the proportion to find the angle ACB will be :

As hyp. 50	-	1.698970
: radius	-	10.000000
:: leg AB, 40		1.602060
		—————
		11.602060
		1.698970
		—————
: sine ACB, $53^{\circ} 8'$		9.903090
		—————

The angle ACB being $53^{\circ} 8'$ the other is consequently $36^{\circ} 52'$.

Making the leg AB radius, the angle BAC may be found

by the following proportion :

$$\begin{array}{rcl}
 \text{As leg AB, } 40 & : & 1.602060 \\
 \text{: radius} & : & 10.000000 \\
 \therefore \text{hyp. } 50 & : & 1.698970 \\
 & & \hline \\
 & & 11.698970 \\
 & & 1.602060 \\
 & & \hline \\
 & : \sec. BAC, 36^\circ 52' & 10.096910
 \end{array}$$

The angles being found, the leg BC may be found by either of the preceding cases. It is 30.

BY NATURAL SINES.

The angle opposite the given leg may be found by the following proportion ;

AS THE HYPOTHENUSE IS TO UNITY OR 1, SO IS THE GIVEN LEG TO THE NAT. SINE OF ITS OPPOSITE ANGLE.

Or, which is the same thing, DIVIDE THE GIVEN LEG BY THE HYPOTHENUSE, AND THE QUOTIENT WILL BE THE NAT. SINE.

EXAMPLE.

The leg AB 40 divided by the hypotenuse 50 gives a quotient 0.80000 which looked in the table of nat. sines, the nearest corresponding number of degrees and minutes will be found to be $53^\circ 8'$, the angle ACB.

BY THE SQUARE ROOT.

In this case the required leg may be found by the square root, without finding the angles ; according to the following PROPOSITION ;

IN EVERY RIGHT ANGLED TRIANGLE, THE SQUARE OF THE HYPOTHENUSE IS EQUAL TO THE SUM OF THE SQUARES OF THE TWO LEGS. HENCE,

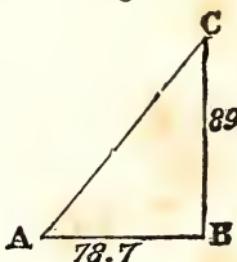

THE SQUARE OF THE GIVEN LEG BEING SUBTRACTED FROM

THE SQUARE OF THE HYPOTHENUSE, THE REMAINDER WILL BE THE SQUARE OF THE REQUIRED LEG.

As in the preceding EXAMPLE ; the square of the leg AB 40 is 1600 ; this subtracted from the square of the hypothenuse 50 which is 2500 leaves 900, the square of the leg BC, the square root of which is 30, the length of leg BC as found by logarithms.

CASE IV.

Fig. 45.

The legs given to find the angles and hypothenuse. Fig. 45.

In the triangle ABC, given the leg AB 78.7 and the leg BC 89 ; to find the angles and hypothenuse.

Making the leg AB radius, the proportion to find the angle BAC will be ;

As leg AB, 78.7	1.895975
: radius	10.000000
:: leg BC, 89	1.949390
	11.949390
	1.895975
: tang. BAC, $48^{\circ} 31'$	10.053415

The angle ACB is consequently $41^{\circ} 29'$.

Making the leg BC radius, the proportion to find the angle BCA will be similar, with the obvious differences.

The angles being found, the hypothenuse may be found by CASE II. It is nearest 119.

BY THE SQUARE ROOT.

In this case the hypothenuse may be found by the square root without finding the angles; according to the following PROPOSITION.

IN EVERY RIGHT ANGLED TRIANGLE, THE SUM OF THE SQUARES OF THE TWO LEGS IS EQUAL TO THE SQUARE OF THE HYPOTHENUSE.

In the above EXAMPLE, the square of AB 78.7 is 6193.69, the square of BC 89 is 7921; these added make 14114.69 the square root of which is nearest 119.

BY NATURAL SINES.

The hypothenuse being found by the square root, the angles may be found by nat. sines, according to the preceding CASE.

Hyp.	Leg BC.	Nat. Sine.
119)	89.00000	(74789
	83 3 . . .	

570	
476	
—	—
940	
333	
—	—
1070	
952	

1180	
1071	
—	—
109	

The nearest degrees and minutes corresponding to the above nat. sine are $48^{\circ} 24'$, for the angle BAC. The difference between this and the angle as found by logarithms is occasioned by dividing by 119, which is not the exact length of the hypothenuse, it being a fraction too much.

PART II.

OBLIQUE TRIGONOMETRY.

The solution of the first two CASES of *Oblique Trigonometry* depends on the following PROPOSITION.

IN ALL PLANE TRIANGLES, THE SIDES ARE IN PROPORTION TO EACH OTHER AS THE SINES OF THEIR OPPOSITE ANGLES.

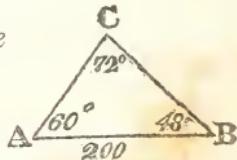

THAT IS, AS THE SINE OF ONE ANGLE IS TO ITS OPPOSITE SIDE, SO IS THE SINE OF ANOTHER ANGLE TO ITS OPPOSITE SIDE. OR, AS ONE SIDE IS TO THE SINE OF ITS OPPOSITE ANGLE, SO IS ANOTHER SIDE TO THE SINE OF ITS OPPOSITE ANGLE.

[**NOTE.** When an angle exceeds 90° make use of its supplement, which is what it wants of 180° . *Note Def. 26. GEOM.*]

CASE I.

Fig. 46.

The angles and one side given to find the other sides. *Fig. 46.*

In the triangle ABC, given the angle at B 48° , the angle at C 72° , consequently the angle at A 60° , and the side AB 200, to find the sides AC and BC.

To find the side AC.

$$\begin{array}{lcl} \text{As sine } ACB, 72^\circ & . & 9.978206 \\ : \text{side } AB, 200 & . & 2.301030 \\ :: \text{sine } ABC, 48^\circ & . & 9.871073 \end{array}$$

$$\begin{array}{r} 12.172103 \\ 9.978206 \end{array}$$

To find the side BC.

$$\begin{array}{lcl} \text{As sine } ACB, 72^\circ & . & 9.978206 \\ : \text{side } AB, 200 & . & 2.301030 \\ :: \text{sine } BAC, 60^\circ & . & 9.937531 \end{array}$$

$$\begin{array}{r} 12.328561 \\ 9.978206 \end{array}$$

$$: \text{side } AC, 156$$

$$: \text{side } BC, 182$$

$$2.260355$$

BY NATURAL SINES.

AS THE NAT. SINE OF THE ANGLE OPPOSITE THE GIVEN SIDE IS TO THE GIVEN SIDE, SO IS THE NAT. SINE OF THE ANGLE OPPOSITE EITHER OF THE REQUIRED SIDES TO THAT REQUIRED SIDE.

Given side 200; nat. sine of 72° , its opposite angle, 0.95115; nat. sine of ABC 48° , 0.74334; nat. sine of BAC 60° 0.86617. Thus,

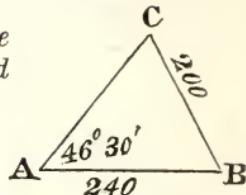

$$0.95115 : 200 :: 0.74334 : 156$$

$$0.95115 : 200 :: 0.86617 : 182.$$

CASE II.

Fig. 47.

Two sides, and an angle opposite to one of them given, to find the other angles and side. Fig. 47.

In the triangle ABC, given the side AB 240, the side BC 200, and the angle at A $46^{\circ} 30'$; to find the other angles and the side AC.

To find the angle ACB.

As side BC, 200	2.301030	Angle at A	$46^{\circ} 30'$
: sine BAC, $46^{\circ} 30'$	9.860562	C	$60^{\circ} 30'$
:: side AB, 240	2.380211		
	12.240773		107.00
	2.301030	Sum of the three angles	180°
	12.240773	Sum of two	107
: sine ACB, $60^{\circ} 30'$ nearly	9.939743	Angle at B	73

The side AC will be found by CASE I. to be nearest 253.

NOTE. If the given angle be obtuse, the angle sought will be acute; but if the given angle be acute, and opposite a given lesser side, then the angle found by the operation may be either obtuse or acute. It ought therefore to be mentioned which it is, by the conditions of the question.

BY NATURAL SINES.

AS THE SIDE OPPOSITE THE GIVEN ANGLE IS TO THE NAT. SINE OF THAT ANGLE, SO IS THE OTHER GIVEN SIDE TO THE NAT. SINE OF ITS OPPOSITE ANGLE.

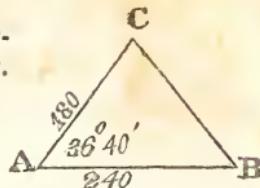

One given side 200, nat. sine of $46^{\circ} 30'$, its opposite angle, 0.72537, the other given side 240.

As 200 : 0.72537 :: 240 : 8.87044 = $60^{\circ} 30'$.

CASE III.

Fig. 48.

Two sides and their contained angle given, to find the other angles and side. Fig. 48.

The solution of this case depends on the following PROPOSITION.

IN EVERY PLANE TRIANGLE, AS THE SUM OF ANY TWO SIDES IS TO THEIR DIFFERENCE, SO IS THE TANGENT OF HALF THE SUM OF THE TWO OPPOSITE ANGLES TO THE TANGENT OF HALF THE DIFFERENCE BETWEEN THEM.

ADD THIS HALF DIFFERENCE TO HALF THE SUM OF THE ANGLES AND YOU WILL HAVE THE GREATER ANGLE, AND SUBTRACT THE HALF DIFFERENCE FROM THE HALF SUM AND YOU WILL HAVE THE LESSER ANGLE.

In the triangle ABC, given the side AB 240, the side AC 180, and the angle at A $36^{\circ} 40'$ to find the other angles and side.

Side AB	:	240	AB	:	240
AC	:	180	AC	:	180
Sum of the two sides		420	Difference		60

The given angle BAC $36^{\circ} 40'$, subtracted from 180° , leaves $143^{\circ} 20'$ the sum of the other two angles, the half of which is $71^{\circ} 40'$.

As the sum of two sides, 420	:	2.623249
: their difference 60	:	1.778151
:: tangent half unknown ang. $71^{\circ} 40'$		10.479695

		12.257846
		2.623249

: tangent half difference, $23^{\circ} 20'$ nearly		9.634597
--	--	----------

The half sum of the two unknown angles,		$71^{\circ} 40'$
The half difference between them,		$23^{\circ} 20'$

Add, gives the greater angle ACB		95 00
----------------------------------	--	-------

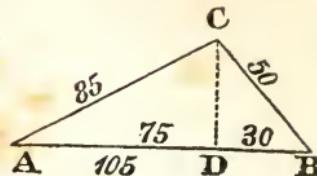

Subtract, gives the lesser angle ABC		48 23
--------------------------------------	--	-------

The side BC may be found by CASE I or II.

CASE IV.

Fig. 49.

The three sides given to find the angles. Fig. 49.

The solution of this case depends on the following PROPOSITION.

IN EVERY PLANE TRIANGLE, AS THE LONGEST SIDE IS TO THE SUM OF THE OTHER TWO SIDES, SO IS THE DIFFERENCE BETWEEN THOSE TWO SIDES TO THE DIFFERENCE BETWEEN THE SEGMENTS OF THE LONGEST SIDE, MADE BY A PERPENDICULAR LET FALL FROM THE ANGLE OPPOSITE THAT SIDE.

Half the difference between these segments, added to half the sum of the segments, that is, to half the length of the longest side, will give the greatest segment; and this half difference subtracted from the half sum will be the lesser segment. The triangle being thus divided, becomes two right angled triangles, in which the hypotenuse and one leg are given to find the angles.

In the triangle ABC, given the side AB 105, the side AC 85, and the side BC 50, to find the angles.

Side AC	-	85	AC	-	-	85
BC	-	50	BC	-	-	50
Sum of the two sides	<hr/>	135	Difference	<hr/>	<hr/>	35
As the longest side AB, 105	-	-	-	-	-	2.021189
: sum of the other two sides, 135	-	-	-	-	-	2.130334
: difference between those sides, 35	-	-	-	-	-	1.544068
						<hr/>
						3.674402
						2.021189
: difference between the segments, 45						<hr/>
						1.653213
Half the side AB	-	-	-	-	-	52.5
Half the difference of the segments	-	-	-	-	-	22.5
Add, gives the greater segment AD	-	-	-	-	-	<hr/> 75.0
Subtract, gives the lesser segment BD	-	-	-	-	-	<hr/> 30.0

Thus the triangle is divided into two right angled triangles, ADC and BDC; in each of which the hypotenuse and one leg are given to find the angles.

To find the angle DCA.

$$\begin{array}{l} \text{As hyp. AC, } 85 \\ : \text{ radius } - - - \\ :: \text{ seg. AD, } 75 \end{array} \quad \begin{array}{r} 1.929419 \\ 10.000000 \\ 1.875061 \end{array}$$

$$\begin{array}{r} \hline 11.875061 \\ 1.929419 \\ \hline \end{array}$$

$$: \text{ sine DCA, } 61^\circ 56'$$

$$9.945642$$

To find the angle DCB.

$$\begin{array}{l} \text{As hyp. BC, } 50 \\ : \text{ radius } - - - \\ :: \text{ seg. BD, } 30 \end{array} \quad \begin{array}{r} 1.698970 \\ 10.000000 \\ 1.477121 \end{array}$$

$$\begin{array}{r} \hline 11.477121 \\ 1.698970 \\ \hline \end{array}$$

$$: \text{ sine DCB, } 36^\circ 52'$$

$$9.778151$$

The angle DCA $61^\circ 56'$ subtracted from 90° leaves the angle CAD $28^\circ 4'$.

The angle DCB $36^\circ 52'$ subtracted from 90° leaves the angle CBD $53^\circ 16'$.

The angle DCA $61^\circ 56'$ added to the angle DCB $36^\circ 52'$ gives the angle ACB $98^\circ 48'$.

This CASE may also be solved according to the following PROPOSITION.

IN EVERY PLANE TRIANGLE, AS THE PRODUCT OF ANY TWO SIDES CONTAINING A REQUIRED ANGLE IS TO THE PRODUCT OF HALF THE SUM OF THE THREE SIDES, AND THE DIFFERENCE BETWEEN THAT HALF SUM AND THE SIDE OPPOSITE THE ANGLE REQUIRED, SO IS THE SQUARE OF RADIUS TO THE SQUARE OF THE CO-SINE OF HALF THE ANGLE REQUIRED.

Those who make themselves well acquainted with TRIGONOMETRY will find its application easy to many useful purposes, particularly to the mensuration of heights and distances. These are here omitted, because, as this work is designed principally to teach the art of common FIELD-SURVEYING, it was thought improper to swell its size, and consequently increase its price, by inserting any thing not particularly connected with that art.

It is recommended to those who design to be surveyors to study TRIGONOMETRY thoroughly; for though a common field may be measured without an acquaintance with that science, yet many cases will occur in practice where a knowledge of it will be found very beneficial; particularly in dividing land, and ascertaining the boundaries of old surveys. Indeed no one who is ignorant of TRIGONOMETRY, can be an accomplished surveyor.

SURVEYING.

SURVEYING is the art of measuring, laying out, and dividing land.

PART I.

MEASURING LAND.

The most common measure for land is the acre ; which contains 160 square rods, poles or perches ; or 4 square rods, each containing 40 square rods.

The instrument most in use, for measuring the sides of fields, is GUNTER's chain, which is in length 4 rods or 66 feet ; and is divided into 100 equal parts, called links, each containing 7 inches and 92 hundredths. Consequently, 1 square chain contains 16 square rods, and 10 square chains make 1 acre.

In small fields, or where the land is uneven, as is the case with a great part of the land in New England, it is better to use a chain of only two rods in length ; as the survey can be more accurately taken.

SECTION I.

PRELIMINARY PROBLEMS.

PROBLEM I. *To reduce two rod chains to four rod chains.*

RULE. If the number of two rod chains be even, take half the number for four rod chains, and annex the links if any ; thus, 16 two rod chains, and 37 links make 8 four rod chains and 37 links.

But if the number of chains be odd, take half the greatest even number for chains, and for the remaining number add 50 to the links : Thus, 17 two rod chains and 42 links make 8 four rod chains and 92 links.

PROBLEM II. *To reduce two rod chains to rods and decimal parts.*

RULE. Multiply the chains by 2, and the links by 4, which will give hundredths of a rod ; thus, 17 two rod chains and 21 links make 34 rods and 84 hundredths ; expressed thus, 34.84 rods.

If the links exceed 25, add 1 to the number of rods and multiply the excess by 4 : thus, 15 two rod chains and 38 links make 31.52 rods.

PROBLEM III. *To reduce four rod chains to rods and decimal parts.*

RULE. Multiply the chains, or chains and links, by 4 ; the product will be rods and hundredths : thus, 8 chains and 64 links make 34.56 rods.

NOTE. The reverse of this rule, that is, dividing by 4, will reduce rods and decimals to chains and links : thus, 105.12 rods make 26 chains and 28 links.

PROBLEM IV. *To reduce square rods to acres.*

RULE. Divide the rods by 160, and the remainder by 40, if it exceeds that number, for roods or quarters of an acre : thus 746 square rods make 4 acres, 2 roods, and 26 rods.

PROBLEM V. *To reduce square chains to acres.*

RULE. Divide by 10 ; or, which is the same thing, cut off the right hand figure : thus, 1460 square chains make 146 acres ; and 846 square chains make 84 acres and 6 tenths.

PROBLEM VI. *To reduce square links to acres.*

RULE. Divide by 100000 ; or, which is the same thing, cut off the 5 right hand figures : thus, 3845120 square links make 38 acres and 45120 decimals.

NOTE. When the area of a field, by which is meant its superficial contents, is expressed in square chains and links, the whole may be considered as square links, and the number of acres contained in the field, found as above. Then multiply the figures cut off by 4, and again cut off 5 figures, and you have the roods ; multiply the figures last cut off by 40, and again cut off 5 figures, and you have the rods.

EXAMPLE. How many acres, roods, and rods, are there in 156 square chains and 3274 square links ?

$$\begin{array}{r} 15)63274 \text{ square links.} \\ \quad 4 \\ \hline \end{array}$$

$$\begin{array}{r} 2)53096 \\ \quad 40 \\ \hline \end{array}$$

$$\begin{array}{r} 21)23840 \\ \quad \quad \quad 40 \\ \hline \end{array}$$

Answer. 15 acres 2 roods and 21 rods.

PROBLEMS for finding the area of right lined figures, and also of circles.

PROBLEM VII. *To find the area of a square or rectangle.*

RULE. Multiply the length into the breadth ; the product will be the area.

PROBLEM VIII. *To find the area of a rhombus or rhomboid.*

RULE. Drop a perpendicular from one of the angles to its opposite side, and multiply that side into the perpendicular ; the product will be the area.

PROBLEM IX. *To find the area of a triangle.*

RULE 1. Drop a perpendicular from one of the angles to its opposite side, which may be called the base ; then multiply the base by half the perpendicular ; or the perpendicular by half the base ; the product will be the area. Or, multiply the whole base by the whole perpendicular, and half the product will be the area.

RULE 2. If it be a right angled triangle, multiply one of the legs into half the other ; the product will be the area. Or, multiply the two legs into each other, and half the product will be the area.

RULE 3. When the three sides of a triangle are known, the area may be found arithmetically, as follows :

Add together the three sides ; from half their sum subtract each side, noting down the remainders ; multiply the half sum by one of those remainders, and that product by another remainder, and that product by the other remainder ; the square root of the last product will be the area.*

EXAMPLE. Suppose a triangle whose three sides are 24, 20, and 18 chains. Demanded the area.

$24 \times 20 \times 18 = 62$, the sum of the three sides, the half of which is 31. From 31 subtract 24, 20, and 18 ; the three remainders will be 7, 11, and 13.

$31 \times 7 = 217$; $217 \times 11 = 2387$; $2387 \times 13 = 31031$, the square root of which is 176.1, or 17 acres 2 roods and 17 rods.

BY LOGARITHMS.

As the addition of logarithms is the same as the multiplication of their corresponding numbers ; and as the number answering to one half of a logarithm will be the square root of the number corresponding to that logarithm : it follows, that if the logarithm of the half sum of the three sides and the logarithms of the three remainders be added together, the num-

* Better expressed thus. From half the sum of the sides subtract each side separately. Multiply the half sum and the several remainders together, and the square root of the product will be the area.—ED.

ber corresponding to one half the sum of those logarithms will be the area of the triangle.

The half sum, 31	-	-	-	1.491362
The first remainder, 7	-	-	-	0.845098
The second remainder, 11	-	-	-	1.041393
The third remainder, 13	-	-	-	1.113943
<hr/>				
The square of the area, 31030.083 nearly				4.491796
<hr/>				
Area 176 square chains 150 square links				2.245893
<hr/>				

RULE 4. When two sides of a triangle and their contained angle, that is, the angle made by those sides, are given, the area may be found as follows :

Add together the logarithms of the two sides and the logarithmic sine of the angle ; from their sum subtract the logarithm of radius, the remainder will be the logarithm of double the area.

EXAMPLE. Suppose a triangle one of whose sides is 105 rods and another 85, and the angle contained between them $28^{\circ} 5'$. Demanded the area.

One side, 105	-	-	-	2.021189
The other side, 85	-	-	-	1.929419
Sine angle, $28^{\circ} 5'$	-	-	-	9.672795
<hr/>				
Subtract radius	-	-	-	13.623403
<hr/>				
Double area, 4200 rods nearly				10.000000
<hr/>				
Double area, 4200 rods nearly				3.623403
<hr/>				

Answer. 2100 rods.

NOTE. Radius may be subtracted by cancelling the left hand figure of the index, or subtracting 10, without the trouble of setting down the ciphers.

BY NATURAL SINES.

Multiply the two given sides into each other, and that product by the natural sine of the given angle ; the last product will be double the area of the triangle.

Nat. sine of the angle $28^{\circ} 5'$ 0.47076.

$105 \times 85 = 8925$, and $8925 \times 0.47076 = 4201$ the double area of the triangle.

PROBLEM X. To find the area of a trapezoid.

RULE. Multiply half the sum of the two parallel sides by the perpendicular distance between them, or the sum of the two parallel sides by half the perpendicular distance, the product will be the area.

PROBLEM XI. *To find the area of a trapezium, or irregular four sided figure.*

RULE. Draw a diagonal between two opposite angles, which will divide the trapezium into two triangles. Find the area of each triangle and add them together. Or, multiply the diagonal by half the sum of the two perpendiculars let fall upon it, or the sum of the two perpendiculars by half the diagonal, the product will be the area.

NOTE. Where the length of the four sides and of the diagonal is known, the area of the two triangles, into which the trapezium is divided, may be calculated arithmetically, according to Prob. IX.
Rule 3.

PROBLEM XII. *To find the area of a figure containing more than four sides.*

RULE. Divide the figure into triangles, and trapezia, by drawing as many diagonals as are necessary, which diagonals must be so drawn as not to intersect each other; then find the area of each of the several triangles or trapezia, and add them together; the sum will be the area of the whole figure.

NOTE. A little practice will suggest the most convenient way of drawing the diagonals; but whichever way they are drawn, provided they do not intersect each other, the whole area will be found the same.

PROBLEM XIII. *Respecting circles.*

RULE I. If the diameter be given the circumference may be found by one of the following proportions: as 7 is to 22, or more exactly, as 113 is to 355, or in decimals, as 1 is to 3.14159, so is the diameter to the circumference.

RULE 2. If the circumference be given the diameter may be found by one of the following proportions: as 22 is to 7, or as 355 is to 113, or as 1 is to 0.31831, so is the circumference to the diameter.

RULE 3. The diameter and circumference being known, multiply half the one into half the other, and the product will be the area.

RULE 4. From the diameter only, to find the area: multiply the square of the diameter by 0.7854, and the product will be the area.

RULE 5. From the circumference only to find the area:

multiply the square of the circumference by 0.07958, and the product will be the area.

RULE 6. The area being given to find the diameter : divide the area by 0.7854, and the quotient will be the square of the diameter ; from this extract the square root, and you will have the diameter.

RULE 7. The area being given to find the circumference : divide the area by 0.07958, and the quotient will be the square of the circumference ; from this extract the square root, and you will have the circumference.

SECTION II.

The following **CASES** teach the most usual methods of taking the survey of fields ; also, how to protract or draw a plot of them, and to calculate their area.

NOTE. The *field-book* is a register containing the length of the sides of a field, as found by measuring them with a chain ; also the bearings or courses of the sides, or the quantity of the several angles, as found by a compass or other instrument for that purpose ; together with such remarks as the surveyor thinks proper to make in the field.

CASE I.

To SURVEY A TRIANGULAR FIELD.

Measure the sides of the field with a chain, and enter their several lengths in a **FIELD BOOK**, protract the field on paper, and then find the area by PROB. IX. **Rule 1.** Or, without plotting the field, calculate the area by PROB. IX. **RULE 3.**

Fig. 50.

 \hline
 \text{Acres} \quad \text{Roods} \quad \text{Rods} \\
 \text{Area } 17 - 2 - 18.56
 \end{array}$$

NOTE. When there are ciphers at the right hand of the links, they may be rejected; remembering to cut off a proper number of figures according to decimal rules.

Observe, That in measuring with a chain, slant or inclined surfaces, as the sides of hills, should be measured horizontally, and not on the plane or surface of the hill; otherwise, a survey cannot be accurately taken. To effect this, the lower end of the chain must be raised from the ground, so as to have the whole in a horizontal line; and the end thus raised must be directly over the point where the chain begins or ends, according as you are ascending or descending a hill; which point may be ascertained by a plummet and line.

CASE II.

TO SURVEY A FIELD IN THE FORM OF A TRAPEZIUM.

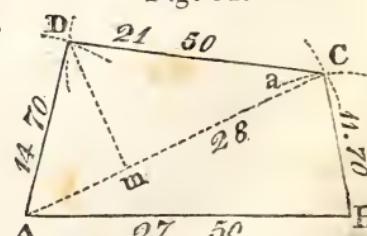

Measure the several sides, and a diagonal between two opposite angles; protract the field, and find the area by PROBLEM XI. Or, without protracting the field, calculate the area according to the *note* at the end of that PROBLEM.

Fig. 51.

FIELD BOOK. See Fig. 51.

Ch. L.

AB	-	27.50
BC	-	11.70
CD	-	21.50
DA	-	14.70
Diag. AC	-	72.

TO PROTRACT THIS TRAPEZIUM.

Draw the side AB the given length; with the diagonal AC 28 and the side BC 11.70 describe cross arcs as at C, from A and B as centres; and the point of intersection will represent that corner of the field: then, with the side CD 21.50 and the side AD 14.70, describe cross arcs as at D, from A and C as centres; and the point of intersection will represent that corner of the field.

TO FIND THE AREA.

<i>Area 31 — 1 —</i>	<i>26.56</i>		

NOTE. The perpendiculars need not be actually drawn; their length may be obtained as follows: From the angle opposite the diagonal open the dividers so as when one foot is in the angular point, as at B, the other, being moved backwards and forwards, may just touch the diagonal at A, and neither go the least above or below it; that distance in the dividers being measured on the scale will give the length of the perpendicular.

CASE III.

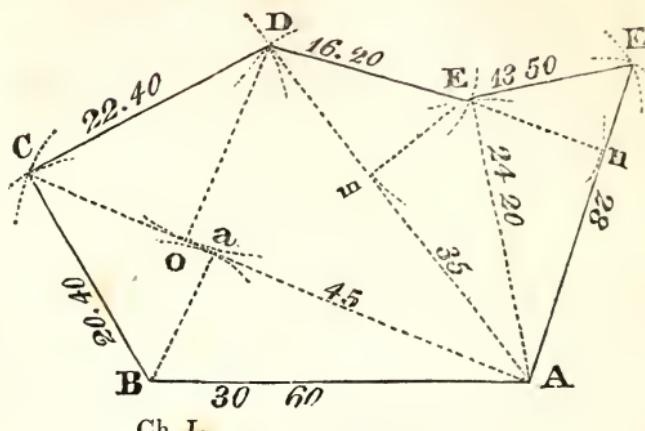

TO SURVEY A FIELD WHICH HAS MORE THAN FOUR SIDES,
BY THE CHAIN ONLY.

Measure the several sides, and from some one of the angles from which the others may be seen, measure diagonals to

them; draw a plot of the field, and find the area by PROBLEM XII.

FIELD BOOK. See Fig. 52.

Fig. 52.

REMARKS.

As each of the sides of the several triangles, into which the preceding plot of a field is divided, is known from the field book, the area of the field may be calculated arithmetically, by finding the area of each triangle, according to PROB. IX. Rule 3; and then adding the whole together. This method, though it may require more time, is preferable to the other, because more accurate. Indeed it is always better to calculate the area of a field arithmetically than geometrically; for in the former no two persons can differ in their calculations; whereas, according to the latter, which is the common method of casting the contents of a field, it is hardly to be expected that any two persons will perfectly agree. The inaccuracy of scales, and the difficulty of determining with precision the length of sides and perpendiculars with a scale and dividers, render it almost if not quite impossible to obtain the exact area of a field, in the method commonly practised, even if the surveyor has measured it accurately in the first place.

Other methods of taking the survey of a field by the chain only are mentioned in some treatises on this subject, but they

are rather curious than useful; and it is much better to ascertain the angles by an accurate compass, or some instrument designed purposely for taking angles.

CASE IV.

TO SURVEY A FIELD WITH A CHAIN AND COMPASS.

Measure the length of the sides with a chain, and take their bearing or course with a compass;* enter these in a field book; plot the field on paper, and calculate the area by the directions already given.

TO PROTRACT OR DRAW A MAP OF A FIELD.

Draw a line to represent a meridian, or north and south line, from which lay off a bearing or course of the first side of the field, with a protractor or from a line of chords; and from a scale of equal parts, measure the length of the side and draw a line to represent it.

At the end of this line draw a line parallel to the meridian line, and then lay off the second side of the field as before taught; proceed in the same manner to draw parallel lines, and lay off the several sides till the whole is protracted.

In protracting a field, let the top of the paper be considered as north, the bottom south, the right hand east, and the left hand west; lay the course to the right or left of the meridian line, according as it is east or west, and upwards or downwards, according as it is north or south.

In all protractions, if the end of the last distance falls exactly on the point from which you began, the course also being right, the field work and protractions are truly taken and performed; if not, an error must have been committed in one of them: in such cases, make a second protraction; if this agrees with the former, it is to be presumed the fault is in the field work; a re-survey must then be taken.

* A compass may be so constructed with two indexes, one moveable and the other fixed, as to ascertain the angle made by two sides, without reference to the bearing of those sides. Such a compass would be particularly useful in surveying land where there are mineral substances which have an influence upon the compass needle, attracting it one way or the other, and thus rendering it impossible to take a course by it with precision.

REMARKS.

The sides of the several triangles into which the plot of a field is divided may be found by trigonometry; and then the area of each triangle may be calculated according to PROB. IX. *Rule 3.* The sum of the areas of the several triangles will be the area of the whole field. This method may require more time, but it is perfectly accurate, since no dependence is placed on the uncertain measurement of scale and dividers.

In the preceding EXAMPLE, suppose the field divided into three triangles. See Fig. 53. In the triangle EAB, the sides EA and AB are known from the FIELD BOOK, and their contained angle is known from the bearing of the sides. The other angles and the side EB may be found by OBLIQUE TRIGONOMETRY, CASE III.; and then there will be the three sides to find the area. In the triangle EBC, the side BC is known from the FIELD BOOK, and the side EB is found as above mentioned; the angle EBA is also found as above: this subtracted from the angle ABC, which may be found from the bearing of the sides AB and BC, will leave the angle EBC: there will then be the two sides and their contained angle to find the third side; and this being found, there will be the three sides to find the area. In the triangle EDC, the sides DE and DC are known from the FIELD BOOK, and their contained angle is known from the bearing of the sides. The side EC and the area may be found as above.

It is recommended to the learner to make these calcula-

tions, as it will improve him in the knowledge of trigonometry.

NOTE. Two sides and their contained angle being given, the area may be found by PROB. IX. *Rule 4.*

ANOTHER METHOD OF PROTRACTING FIELDS.

Without drawing parallel lines at the end of each side, a field may be protracted by the angles made by the several sides; and the angle made between any two sides may be found by the following RULES.

RULE 1. If the course or bearing of one of the sides is north and the other south, one east and the other west, subtract the less course from the greater.

RULE 2. If one is north and the other south, and both east or west, add both courses together.

RULE 3. If both are north or south, and one east and the other west, subtract their sum from 180° .

RULE 4. If both are north or south, and both east or west, add the less course, and the supplement of the greater.

In each case, the result will give the angle contained by the two sides.

To protract a field according to the preceding rules is preferable to the method of doing it by parallel lines, though it may not be so easy to the learner at first. It is difficult to draw parallel lines with perfect accuracy, and a small deviation from a true line may make considerable difference in the plot of a field.*

Fig. 54.

* See Appendix No. 7.

To DRAW A PLOT OF THIS FIELD, ACCORDING TO THE PRECEDING RULES.

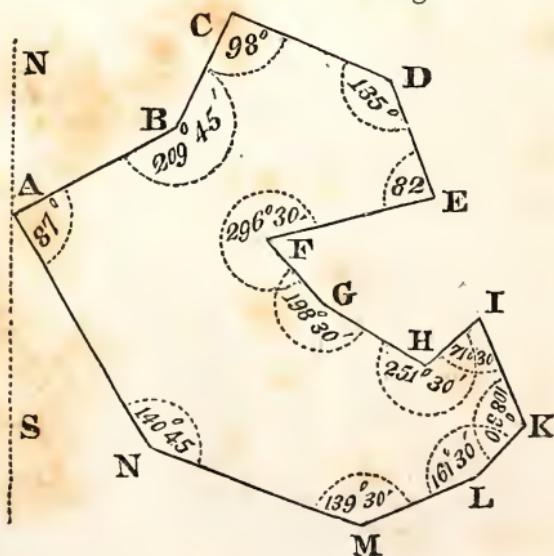

Having drawn the side AB, according to the directions before given for laying off the first course and distance, compare the first and second courses together, and they will be found to be both north and both east; consequently, the angle between them is found by RULE 4, as follows: $16^{\circ} 30'$ the less course, and 98° the supplement of the greater being added, the sum is $114^{\circ} 30'$, for the angle at B. Compare the second and third courses, and they will be found to be one north and one south, and both east; consequently, according to RULE 2, 82° the second course added to 17° the third course, the sum 99° is the angle at C. The third and fourth courses are both south, and one east and the other west. The angle between them at D is 126° ; for 17° the third course added to 37° the fourth course is 54° , which subtracted from 180° leaves 126° , according to RULE 3. The fourth and fifth courses are one south and the other north, and both west. According to RULE 2, 37° the fourth course added to 49° the fifth course, the sum 86° is the angle at E.

A little practice will render this mode of protracting a field familiar and easy, and an attention to the courses will show in what direction the angle is to be made.

CASE V.

TO SURVEY A FIELD FROM ONE STATION AT ANY PLACE WITHIN THE FIELD, FROM WHICH THE SEVERAL ANGLES MAY BE SEEN.

Take the bearing of the angles, and measure their distance from the station.

FIELD BOOK. See Fig. 56.

Fig. 56.

- From station to A. N. 20° W. 8.70
 B. N. 60 E. 10.
 C. N. 87 E. 11.40
 D. S. 15 E. 10.50
 E. S. 60 W. 12.
 F. N. 65 W. 8.78

TO PROTRACT THIS FIELD.

Draw a meridian line as N. S. From some point in that line as a centre, lay off the bearing and distance to the several angles, and draw lines from one angle to another, as AB, BC, CD, &c.

TO FIND THE AREA.

The Area may be calculated according to PROB. XII. by measuring diagonals and perpendiculars; or more accurately according to PROB. IX. RULE 4.

As the bearing and distance of the lines from the station to the several angles are known, two sides and their contained angle are given in each of the triangles into which the plot is divided; the area may, therefore, be readily calculated by the RULE above referred to.

NOTE. As in the operation, the logarithm of radius is to be subtracted from the sum of the other logarithms, it may be done by rejecting the left hand figure, without the trouble of putting down the ciphers and subtracting.

CASE VI.

TO SURVEY A FIELD FROM SOME ONE OF THE ANGLES, FROM WHICH THE OTHERS MAY BE SEEN.

From the stationary angle take the bearing and distance to each of the other angles, with a compass and chain.

Fig. 57.

FIELD BOOK. See Fig. 57.

			Ch. L.

FC.	N.	10 W.	21.20
FD.	N.	7 E.	16.95
FE.	N.	30 E.	8.50

TO DRAW A PLOT OF THIS FIELD.

Draw a meridian line to pass through the stationary angle as at F. From the point F, lay off the bearing and distance to the several angles, and connect them by lines, as FG, FA, FB, &c.

The area may be calculated as taught in the preceding CASE.

CASE VII.

TO SURVEY A FIELD FROM TWO STATIONS WITHIN THE FIELD, PROVIDED THE SEVERAL ANGLES CAN BE SEEN FROM EACH STATION.

Find the bearing from each station to the respective angles; and also the bearing and distance from one station to the other.

FIELD BOOK. See Fig. 58.

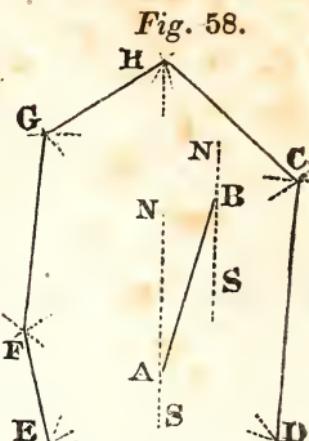

Fig. 58.

BH.	N.	24 0	W.

Stationary line AB: N. 14° E. 20 chains.

To PROTRACT THIS FIELD.

At the first station A, draw a meridian line and lay off the bearings to the respective angles; draw the stationary line AB, according to the bearing and distance; at B, draw a meridian line parallel to the other, and lay off the bearings to the angles, as taken from this station; from each station draw lines through the degree which shows the bearing of each angle, as marked by the protractor or line of chords, and the points where those lines intersect each other will be the angles of the field. Connect those angular points together by lines, and those lines will represent the several sides of the field.

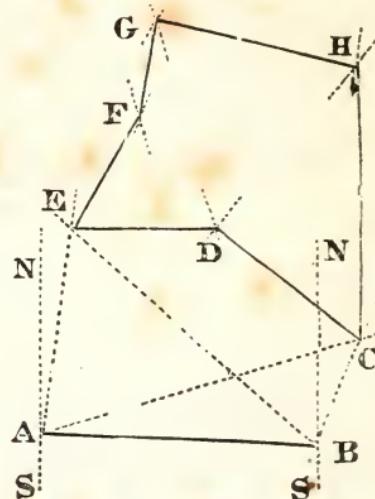

CASE VIII.

To SURVEY AN INACCESSIBLE FIELD.

Fix upon two stations at a convenient distance from the

field, from each of which the several angles may be seen ; from each station take the bearing of the angles ; and take the bearing and distance from one station to the other.

Fig. 59.

FIELD BOOK. See Fig. 59.

Ch. L.
Stationary distance AB, S. 88° 30' E. 19.20.

The directions given in the last CASE for plotting the field, will apply in this CASE also ; and the area in this and the preceding CASE may be calculated in the manner pointed out in CASE IV. by dividing the plot into triangles and measuring diagonals and perpendiculars. Or the sides may be found by trigonometry, and the area calculated arithmetically, as already taught.

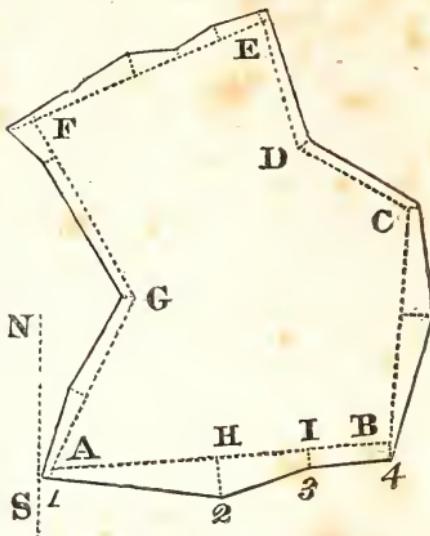

CASE IX.

To SURVEY A FIELD WHERE THE BOUNDARY LINES ARE

VERY IRREGULAR, WITHOUT NOTICING WITH THE COMPASS EVERY SMALL BEND.

Fig. 60.

Begin near one corner of the field, as at A, Fig. 60, and measure to the next large corner, as B, in a straight line; noticing also the bearing of this line. From the line take offsets to the several bends, at right angles from the line; noticing in the FIELD BOOK at what part of the line they are taken, as at A 1, H 2, I 3, B 4. Proceed in the same manner round the field. In the figure the dotted lines represent the stationary lines, and the black lines the boundaries of the field.

at 4.34	0.30	at 3.80	0.80
DE. N. $11^{\circ} 10'$ W. 4.20	0.30	the end	0.40

TO PROTRACT THIS FIELD.

Draw the stationary lines according to the directions in CASE IV. From A make an offset of 56 links to I; measure from A to H 540 links, and make the offset, H 2, 140 links; measure from A to I 826 links, and make the offset I 3, 36 links at B make the offset B 4, 36 links. Proceed in the same manner round the field, and connect the ends of the offsets by lines, which will represent the boundaries of the field.

To FIND THE AREA.

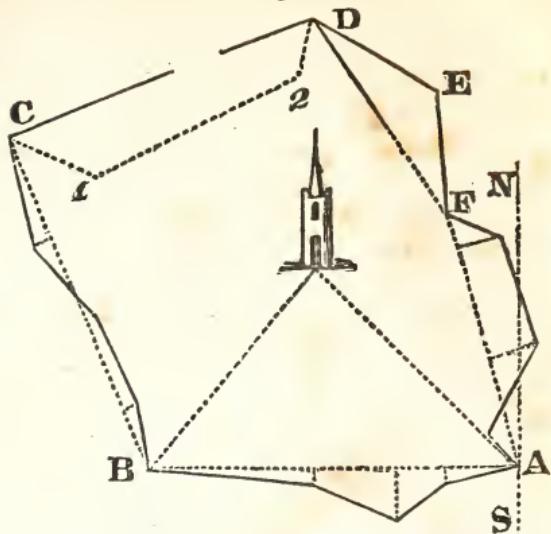

Find the area within the stationary lines as before taught ; then of the several small trapezoids, rectangles, and triangles made by the stationary lines, offsets, and boundary lines, and add the whole together : thus, add 56 links the offset A 1 to 140 links the offset H 2 and multiply their sum 196, by half 540, the length of the line AH, and the product, 52920 square links, will be the area of the trapezoid AH 21 ; again, add 140, the offset H 2 to 36, the offset I 3, and multiply their sum, 176, by half 286, the length of the line HI, and the product, 25168 square links, will be the area of the trapezoid HI 32. Proceed in the same manner to calculate the area of all the trapezoids, triangles, &c.

CASE X.

To SURVEY A FIELD BY TAKING OFFSETTS BOTH TO THE RIGHT AND LEFT ; THAT IS, WITHIN AND WITHOUT THE FIELD, AS OCCASION SHALL REQUIRE, IN CONSEQUENCE OF THE STATIONARY LINES CROSSING THE BOUNDARY LINES ; ALSO, BY INTERSECTIONS, THAT IS, TAKING THE BEARING OF AN INACCESSIONABLE CORNER FROM TWO STATIONS.

The directions given in the preceding CASE, together with the following FIELD BOOK, will show the learner how to survey a field like the following, and also to protract it when surveyed.

Fig. 61.

FIELD BOOK.
See Fig. 61.

Offsets to the Left	Bearing and distance.	Offsets to the Right	Remarks.
Ch. L. 1.12 3.40 1.25	AB. N. $88^\circ 0'$ W. 22.12 at 4.25 7.40 13.	Ch. L.	A tower bears from A. N. 48° W.

	DF. S. $35^\circ 0'$ E. 15.15		E, an inaccessible corner. bears from D. S. $65^\circ 30'$ E.
2.20 2.32	FA. S. $15^\circ 15'$ E. 15.10 at 1.20 7.45 12.25	0.36	E, the inaccessible corner, bears from F. N. 4° W.

NOTE.—To draw a tree, house, tower, or any other remarkable object, in its proper place, in the plot of a field—from any two stations, while surveying the field take the bearing of an object, and the intersection of the lines, which represent the bearings, will determine the place of the object, in the same manner that the tower is drawn in the figure.

TO FIND THE AREA OF THE ABOVE FIELD.

Find the area within the stationary lines, and then of the several small trapezoids, &c. remembering to distinguish those without the stationary lines from those which are within. Subtract the area of those within the stationary lines from the area of those without, and add the remainder to the area contained within the stationary lines; the sum will be the whole area of the field.

[Or, add the areas of those without the stationary lines, to the area contained within those lines, and subtract from the sum, the areas of the several triangles, trapezoids, &c. within the stationary lines.]

SECTION III.

RECTANGULAR SURVEYING, OR AN ACCURATE METHOD OF CALCULATING THE AREA OF A FIELD ARITHMETICALLY, FROM THE FIELD BOOK, WITHOUT THE NECESSITY OF PROTRACTING IT, AND MEASURING WITH A SCALE AND DIVIDERS, AS IS COMMONLY PRACTISED.

I. Survey the field in the usual method, with an accurate compass and chain, and from the field book set down, in a traverse table, the course or bearing of the several sides, and their length in chains and links, or rods and decimal parts of a rod; as in the 2nd and 3d columns of the following EXAMPLE.

EXAMPLE I.

2. Calculate by RIGHT ANGLED TRIGONOMETRY, CASE I, or find by the table of difference of latitude and departure,* or

*For an explanation of this table, and the manner of using it, see the remarks preceding the table.

by the table of natural sines,* the northing or southing, easting or westing, made on each course, and set them down against their several courses in their proper columns, marked N. S. E. W.

NOTE. To determine whether the latitude and departure for any particular course and distance are accurately calculated, square each of them; and if they are right, the sum of their squares will equal the square of the distance, for the following reason: the latitude and departure represent the two legs of a right angled triangle, and the distance the hypotenuse; and it is a mathematical truth, that the square of the hypotenuse of any right angled triangle is equal to the sum of the squares of the two legs.

3. If the survey has been accurately taken, the sum of the northings will equal that of the southings, and the sum of the eastings will equal that of the westings. If, upon adding up the respective columns, these are found to differ very considerably, the field should be again surveyed; as some error must have been committed, either in taking the courses or measuring the sides. If the difference is small, a judicious, experienced surveyor will judge from the nature of the ground, or shape of the field surveyed, where the mistake was most probably made, and will correct accordingly. Or, the northings and southings, and the eastings and westings may be equalled by balancing them, as follows: subtract one half the difference from that column which is the largest, and add it to that column which is the smallest; and let the difference, to be added or subtracted, be divided among the several courses, according to their length.

In EXAMPLE I. the upper numbers are the northings, &c. as found by a table of difference of latitude and departure. The several columns being added, the northings are found to exceed the southings 47 links, and the westings to exceed the eastings 24 links. [47 being uneven, drop a link from the northings, and it becomes 46. Let half of this (23) be taken from the northings, and added to the southings;] likewise, take 12 links from the westings, and add it to the eastings. Take from the first course of the northings 12 links, from the second 7, and from the third 5; to the first southing add 7 links, to the second 10, and to the third 6; add to the first easting 3 links, to the second 3, to the third 4, and to the fourth 2; take from the first westing 5 links, from the second 4, and from the third 3. [These are the proportional correc-

* See the remarks preceding the table of natural sines.

tions belonging to each, as found by calculation.*] The lower numbers will then represent the northings, &c. as balanced.

4. These columns being balanced, proceed to form a departure column, or a column of meridian distances; which shows how far the end of each side of the field is east or west of the station where the calculation begins. This column is formed by a continual addition of the eastings, and subtraction of the westings; or by adding the westings and subtracting the eastings: see EXAMPLE I.

The first easting, 20.74, is set for the first number in the departure column; to this add 24.38, the second easting, and it makes 45.12, for the second number; to this add 30.04, the third easting, and it makes 75.16, for the third number; to this add 9.56, the fourth easting, and it makes 84.72, for the fourth number; the fifth course being south, it is evident the meridian distance will remain the same, therefore, place against it the same easting as for the preceding course; from this subtract 39.95, the first westing, and it leaves 44.77, for the sixth course; from this subtract 23.75, the second westing, and it leaves 21.02, for the seventh course; from this subtract 21.02, the last westing, and it leaves 0.0 to be set against the last course, which shows that the additions and subtractions have been accurately made. For as the eastings and westings equal each other, it is evident that one being added and the other subtracted, there will be in the end no remainder.

5. The next step in the process is to form a second departure column, the numbers in which show the sum of the meridian distances at the end of the first and second, second and third, third and fourth courses, &c.

The first number in this column will be the first in the other departure column; to which add the second number in that column for the second in this; for the third add the second and third; and for the fourth, the third and fourth; and so on until the column be completed. See EXAMPLE I.

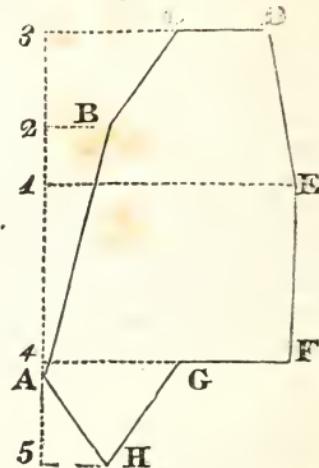

The first number to be placed in the second departure column is 20.74; to this add 45.12, and it makes 65.86 for the second number; to 45.12 add 75.16, and it makes 120.28, for the third number; to 75.16 add 84.72, and it makes 159.88 for the fourth number; to 84.72 add 84.72, and it makes 169.44 for the fifth number; to 84.72 add 44.77, and it makes 129.49 for the sixth number; to 44.77 add 21.02, and it makes 65.79 for the seventh number; to 21.02 add 0.0, and it makes 21.02 for the eighth number.

6. When the work is thus far prepared, multiply the several numbers in the second departure column by the northings or southings standing against them respectively; place the

products of those multiplied by the northings in the column of north areas, and of those multiplied by the southings in the column of south areas ; add up these two columns and subtract the less from the greater ; the remainder will be double the area of the field in square rods or square chains and links, whichever measure was used in the survey.

[In the preceding explanations, the meridian is supposed to pass through the extreme west angle of the field. It is best always to take the extreme east or west angle.]

Fig. 62.

*Demonstration of the preceding rules.
See Fig. 62, and EXAMPLE I.*

The dotted line A 2 represents the northing, and the line 2 B the easting made by the first course ; these multiplied together, that is, $77.15 \times 20.74 = 1600.0910$, which is double the area of the triangle A2B, as is evident from the rule to find the area of a triangle, PROB. IX. Rule I. This number is to be placed for the first number in the column of north areas. The line 3C represents the sum of the eastings made by the first and second courses, which is 45.12, the second number in the first departure column ; if to this you add 20.74 the length of the line 2B you have 65.86, which is the second number in the second departure column, and which represents the sum of the two lines 3C and 2B. These two lines, with the line 2 3 which represents the northing made by the second course, and the line BC, one of the sides of the field, form a right angled trapezoid. Now, by the rule to find the area of such a trapezoid, See PROB. X. $65.86 \times 31.66 = 2085.1276$, double the area of the trapezoid 2BC3. Place this product for the second number in the column of north areas.

To the line 3C add CD 30.04, the easting made by the third course, and you have 75.16, which is the sum of the

eastings made by the three first courses, and the third number in the first departure column. To this add 9.56, the easting of the fourth course, and you have 84.72, the length of the line 1E, which represents the sum of the eastings made by the four first courses, and is the fourth number in the first departure column. These two, viz. the lines 3D 75.16 and 1E 84.72, added together make 159.88, the fourth number in the second departure column; which, being multiplied by 49.15, the length of the line 3 1 which represents the southing made by the fourth course, will give double the area of the trapezoid 1ED3. The number thus produced is 7858.1020, which is to be placed for the first number in the column of south areas.

The fifth course being due south, it is evident the sum of the eastings will remain the same as at the end of the fourth course; that is, the line 4F equals the line 1E, which is 84.72. These added make 169.44, the fifth number in the second departure column. This, being multiplied by 54.10, the length of the line EF, which is the southing of the fifth course as corrected in balancing, and the same as the line 1 4 will give double the area of the parallelogram 1EF4, which is 9166.7040, the second number in the column of south areas.

From the line AF 84.72 subtract 39.95, which is a west course, and it leaves 4G 44.77, the sum of the eastings, or the meridian distance, at the end of the sixth course, and the sixth number in the first departure column. From this subtract 23.75 the westing made by the seventh course, and you have 21.02, the length of the line 5H, which is the meridian distance at the end of the seventh course, and the seventh number in the first departure column. The line 4G 44.77 added to the line 5H 21.02 make 65.79, the seventh number in the second departure column. This being multiplied by 32.21, the length of the line 4 5 which is the southing of the seventh course, will give double the area of the trapezoid 4GH5, which is 2119.0959, the third number in the column of south areas.

The line H5, 21.02, is the westing of the last course, and the last number in the second departure column. This being multiplied by 26.65, length of the line 5A, and the northing of the last course, produces 560.1830, which is double the area of the triangle A5H, and the last number in the column of north areas.

NOTE. It will be observed that against the third and sixth courses there are no areas; the reason is that these courses being one east and the other west, there is no northing or southing to be multi-

plied into them : regard can therefore be had to them only in forming the departure columns.

By inspecting the *figure*, and attending to the preceding illustrations, it will be seen that the three north areas represent double the area of the triangle A2B, the trapezoid 2BC3, and the triangle A5H, all of which are without the boundary lines of the field: also, that the three south areas represent double the area of the trapezoid 3DE1, the parallelogram 1EF4, and the trapezoid 4GH5 ; and that these include not only the field but also what was included in the north areas. Therefore the north areas subtracted from the south, the remainder will be double the area of the field, contained within the black lines.

ADDITIONAL DIRECTIONS AND EXPLANATIONS.

The northings and southings may be added and subtracted instead of the eastings and westings ; then there will be two latitude columns instead of departure columns, and the numbers in the second latitude column must be multiplied into the eastings and westings, and you will have east and west areas.

When the course is directly north or south, the distance must be set in the north or south column ; when east or west, in the east or west column. There will therefore sometimes be no number to be added to or subtracted from the number last set in the latitude or departure column ; then the number last placed in the column must be brought down and set against such course ; as in EXAMPLE I. at the 5th course. It may also sometimes be the case, that there will be no number to multiply into the number in the second latitude or departure column ; then that number must be omitted, and against such course there will be no area, as in EXAMPLE I. at the 3d and 6th courses.

When the northings or southings, eastings or westings, beginning at the top, will not admit of a continual addition of the one and subtraction of the other, without running out before you get through the several courses, you may begin at such a course in the field book as will admit of a continual addition and subtraction ; and when you get to the bottom go to the top, and you will end in cipher at the course next above that

where you began: as in EXAMPLE II. which begins at the 9th course to add the eastings and subtract the westings.*

Area 110 Acres, 2 Roods, 23 Rods.

NOTE. In the above EXAMPLE you might begin at the 4th course to add the westings and subtract the eastings; or at the 6th course to add the northings and subtract the southings: or at the 11th course to add the southings and subtract the northings. So in every survey, some place may be found where you may begin to add and subtract, without running out before you get through all the courses.*

When a field is very irregularly shaped, it will often happen that parts of the same area will be contained in several different products in the columns of areas; but in the final result, one column being subtracted from the other will leave what is included within the boundary lines of the field.

* Much the most convenient method is to place the course at which you begin to add and subtract as the head of the FIELD BOOK. The surveyor may easily do this, by observing in the field, which angle of the field is furthest east or west, north or south.—ED.

Fig. 63.

DEMONSTRATION.
See Fig. 63, and Ex-
AMPLE II.

The area standing against the 9th course,* which is where the calculation begins, is the triangle 12K, all without the field.

The area against the 10th course is the trapezoid 2KL3, also without the field.

The area against the 11th course is the trapezoid 4ML3. This is a south area, and contains a part of the field and also part of the preceding north area.

The area against the 12th course is the trapezoid 5NM4, part within and part without the field.

The area against the 13th course is the trapezoid 6AN5, part within and part without the field.

The area against the 1st course is the trapezoid 6AB7, part within and part without the field. This is a north area, and to be ultimately subtracted from the south areas; but this includes a part of the preceding south areas, viz. the space nAso; it will, however, be seen hereafter that this same space is included in another south area. This north area contains also a part of the first north area, viz. the space 6no7; but the same space is also included in another south area.

The area against the 2d course is also a north area, and is the trapezoid 7BC8. This trapezoid contains the space sBCx, without the field; the space osxw, within the field; and the space 7ow8, without the field. But the space osxw will be contained in the next south area; and the space 7ow8 which was contained in the two first north areas, will be contained in the next south area.

By examining the whole *figure* in this manner, it will be

* The numbering here, corresponds not to the diagram, but to the FIELD-BOOK on the last page. After the 8th course, likewise, in the engraving, the numbers are incorrect, the true 9th course, DE, being left without a number, and the others numbering 9, 10, &c. when they should be 10, 11, &c.—Ed.

seen that the north areas contain all without the field that is taken into the calculation, and some of it twice over ; they also contain part of the area within the field. The south areas contain all within the field, and all without the field that is contained in the north areas. They also contain, twice over, so much of the field as is included in any of the north areas ; and likewise, twice over, that part without the field which is contained twice in the north areas. So that subtracting the north from the south areas leaves double the area of the field.

This method of calculating the area of a field by the northings, southings, eastings, and westings, divides the field, with a certain quantity of the adjoining ground, into right angled triangles, right angled trapezoids, parallelograms or squares, as may be seen by the *figures*. It may therefore with propriety be called RECTANGULAR SURVEYING.*

A USEFUL PROBLEM.

TO FIND THE TRUE AREA OF A FIELD WHICH HAS BEEN MEASURED BY A CHAIN TOO LONG OR TOO SHORT.

Calculate the area as if the chain was of a true length, then institute the following proportion :

As the square of the length of the true chain ;
Is to the area, as found by the chain made use of ;
So is the square of the length of that chain ;
To the true area of the field.

EXAMPLE.

Suppose a field, measured by a two rod chain 3 inches too long, is found to contain 41 acres 1 rood and 33 rods, what is the true area.

As the square of 33 feet, the true length of a two rod chain ; is to 41 acres 1 rood and 33 rods ; so is the square of 33 feet 3 inches, the length of the chain used in the survey ; to 42 acres and 13 rods. 33 feet = 396 inches. $396 \times 396 = 156816$ square inches.

$$41 \text{ acres } 1 \text{ rood } 33 \text{ rods} = 6633 \text{ rods.}$$

33 feet 3 inches = 399 inches. $399 \times 399 = 159201$ square inches.

$$159201 \times 6633 \div 156816 = 6733 \text{ rods.}$$

$$6733 \div 160 = 42 \text{ acres } 13 \text{ rods, the true area.}$$

* See Appendix, No. 6.

PART II.**LAYING OUT LAND.****PROBLEM I. TO LAY OUT ANY NUMBER OF ACRES IN THE FORM OF A SQUARE.**

Annex 5 ciphers to the number of acres, which will turn them into square links, the square root of which will be the side of the square in links.

EXAMPLE I. It is required to lay out 810 acres in the form of a square.

Answer. Each side of the square must be 9000 links, or 90 chains.

PROBLEM II. TO LAY OUT ANY NUMBER OF ACRES IN THE FORM OF A PARALLELOGRAM WHEREOF ONE SIDE IS GIVEN.

Divide the number of acres when turned into square links, by the given side ; the quotient will be the side required.

EXAMPLE. What must be the longest side of a rectangle, which is to contain 25 acres, when the shortest side is 5 chains and 50 links ?

Answer. $2500000 \div 550 = 4545$ links for the longest side.

PROBLEM III. TO LAY OUT ANY NUMBER OF ACRES IN A FIELD, 3, 4, 5, 6, &c. TIMES AS LONG AS IT IS BROAD.

Divide the acres, when turned into square links, by the ratio between the length and breadth ; the square root of the quotient will be the shortest side.

EXAMPLE. It is required to lay out 100 acres 5 times as long as it is broad.

Answer. $10000000 \div 5 = 2000000$ the square root of which is 1414 links for the shortest side, and the longest will be 7070 links.

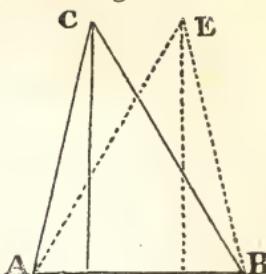

PROBLEM IV. TO MAKE A TRIANGLE WHICH SHALL CONTAIN A GIVEN NUMBER OF ACRES, BEING CONFINED TO A CERTAIN BASE.

Double the given number of acres, to which, annex 5 ciphers, and divide by the base ; the quotient will be the perpendicular height in links.

EXAMPLE. Upon a base of 40 chains to lay out 100 acres in a triangular form.

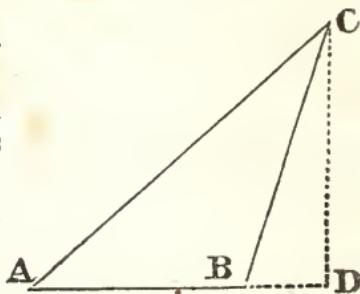

Answer. 5000 links or 50 chains will be the length of the perpendicular.

Fig. 64.

The perpendicular may be erected from any part of the base: thus, the triangle ABC, *see Fig. 64*, is the same as ABE, each containing 100 acres.

Fig. 65.

When the given base is so situated that a perpendicular of sufficient length cannot be erected therefrom, continue the base as from B to D, *fig. 65*, from which erect the perpendicular DC, and complete the triangle ABC, which will contain 100 acres.

PART III.

DIVIDING LAND.

As different fields are so variously, and many of them irregularly shaped, and as they are required to be divided in many different proportions, it is difficult to give rules which will apply to particular cases. The business of dividing land must therefore be left, in a great measure, to the skill and judgment of the surveyor; who, if he is well acquainted with trigonometry, and with measuring land, will not find it difficult, after a little practice, to divide a field in such a manner as shall be desired. If he has before him a plot of the field, and knows the number of parts into which it is to be divided, and the proportion which each part is to bear to the others, he will readily find out where the dividing lines are to be drawn.

A few RULES and EXAMPLES will be given for the general instruction of the learner.

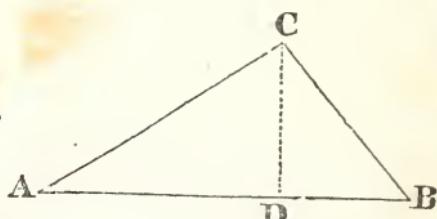

PROBLEM I. TO CUT OFF ANY NUMBER OF ACRES FROM A SQUARE OR RECTANGLE.

Say, as the whole number of acres in the field ; is to the length of the square or length or breadth of the rectangle ; so is the number of acres proposed to be cut off ; to their proportion of the length or breadth.

PROBLEM II. To CUT OFF ANY NUMBER OF ACRES BY A LINE FROM ANY ANGLE OF A TRIANGLE.

Measure the base, or side opposite the angle from which the dividing line is to be drawn ; then say, as the number of acres in the whole triangle ; is to the whole base ; so is the given number of acres ; to their part of the base.

Fig. 66.

EXAMPLE. See *Fig. 66.*

In the triangle ABC, which contains 48 acres, it is required to cut off 18 acres, by a line proceeding from C to the base AB, which is 40 chains.

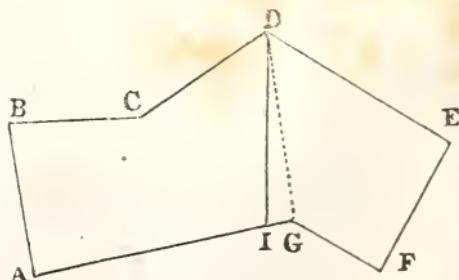

As 48 : 40 :: 18 : 15

Lay 15 chains on the base from B to D, and draw the line CD. The triangle will then be divided as was proposed ; BCD containing 18 acres.

PROBLEM III. TO TAKE OFF ANY GIVEN NUMBER OF ACRES FROM A MULTANGULAR FIELD.

Fig. 67.

EXAMPLE 1. See *Fig. 67.*

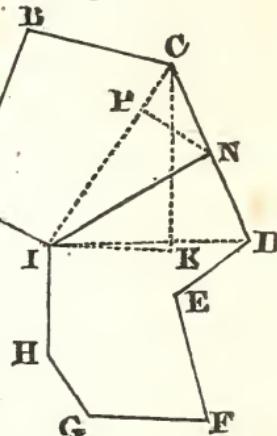

Let ABCD, &c. be the plot of a field containing 11 acres, from which it is required to cut off 5 acres.

Join two opposite corners of the field as D and G, with the line DG (which you may judge to be near the partition line) and find the area of the part DEFG, which, suppose, may want 140 rods of the quantity proposed to be cut off. Mea-

sure the line DG, which, suppose to be 70 rods; divide 140 by 35 the half of DG, and the quotient 4 will be the length of the perpendicular of a triangle, whose base is 70 and the area 140. Lay off 4 rods from G to I, and draw the line DI, which will be the dividing line.*

EXAMPLE II. See Fig. 68.

Fig. 68.

Let ABCD, &c. be a tract of land to be divided into two equal parts, by a line from I to the opposite side CD; to find arithmetically on what part of the line CD the dividing line IN will fall; or to find the distance CN.

FIELD BOOK.

			Rods.		Rods.

EF.	S.	15 30	E.	76	IA. N. 62 15 W. 59
					Acres Rood Rods
					Whole area 152 — 1 — 25

Find the area of the part IABC, according to SECTION III. page 57, as follows: set the latitude and departure of the three first sides, IA, AB, and BC, in their proper columns, in a traverse table; and place as much southing, viz. 109.1, equal to the line CK, and as much westing, viz. 71.7, equal to the line Kl, as will balance the columns. This southing and westing will be the latitude and departure made by the line CI. The area of IABC will be found to be 8722 rods, which is less than half the area of the whole field by 3470 rods, the quantity to be contained in the triangle ICN.

* This explanation supposes DG and AG at right angles to each other. When they are not at right angles, the height GI must not be measured on the side of the field.—ED.

Find the bearing and distance of CI by **RIGHT ANGLED TRIGONOMETRY, CASE IV.** as follows :*

As CK, the southing of CI, 109, nearly	-	-	-	2.037426
: radius	-	-	-	10,000000
:: CI, the westing of CI, 71.7	-	-	-	1.855519
				11.855519
				2.037426
: tangent course S. $33^{\circ} 20'$ W.	-	-	-	9.818093
As sine course $33^{\circ} 20'$	-	-	-	9.739975
: departure CI 71.7	-	-	-	1.855519
: radius	-	-	-	10,000000
				11.855519
				9.739975
: Distance IC 130.5	-	-	-	2.115544

NOTE. In this way the course and distance may be found from any angle of a field to another.

Having found the line CI, divide 3470, the number of rods to be contained in the triangle ICN, by one half the line CI, viz. 65.25 ; the quotient will be the length of the perpendicular PN, viz. 53.18.

Now, by the bearings of CI and CD, it appears that they form an angle of $60^{\circ} 20'$; wherefore, in the triangle CPN are given the side PN 53.18, and the angle at C $60^{\circ} 20'$, to find the hypotenuse CN.

As sine PCN $60^{\circ} 20'$	-	-	-	9.938980
: side PN 53.18	-	-	-	1.725748
:: radius	-	-	-	10,000000
				11.725748
				9.938980
: hyp. CN 61.2	-	-	-	1.786768

Thus the dividing line must go from I to a point on the line CD, which is 61.2 rods from C. The bearing and distance of this line may be found by the directions given above for finding the bearing and distance of the line CI. Or, they may be found by oblique trigonometry, **CASE III.**

* The mode given above is undoubtedly the most correct, but the use of the traverse table will save many figures. From that table the course and distance of CI, may be found at sight.—ED.

ANOTHER METHOD OF FINDING THE DISTANCE CN.

Having ascertained the latitude and departure of the line CI, set them down in a traverse table; find the latitude and departure of the line CD, and place them in the table; the difference between the northing of the line IC, and the southing of the line CD will be the southing of the line DI, viz. 6.6; and the sum of the eastings of those lines, as they are both easterly, will be the westing of the line DI, viz. 123.9. Proceed to calculate the area of the triangle ICD, which will be found to be 6522 rods, nearly.

NOTE. As in this triangle two sides and their contained angle are given, the area may be found by PROB. IX. rule 4, page 40.

Having found the area of this triangle, proceed to find CN according to PROB. II. page 74, as follows:

As the area of the triangle ; is to CD the base ; so is the quantity to be contained in the triangle ICN ; to CN its proportion of the base.

As 6522 : 115 : : 3470 : 61.19.

A THIRD METHOD OF FINDING THE DISTANCE CN.

To the logarithm of double the area to be contained within the triangle ICN add radius; from this sum subtract the logarithmic sine of the angle at C; and from the remainder subtract the logarithm of the side IC; the last remainder will be the logarithm of the side CN.

The double area of the triangle ICN is 6940; the angle at C is $60^{\circ} 20'$; the side IC is 130.

Double area 6940	-	-	-	3.841359
Radius	-	-	-	10.000000
				13.841359
Sine ICN $60^{\circ} 20'$	-	-	-	9.938980
				3.902379
Side IC 130.5	-	-	-	2.115544*
Side CN 61.21	-	-	-	1.786835

* The log. of IC, as found by calculation on page 76, is employed, instead of taking from the tables, that of 130.5, which is not the exact length of IC.—ED.

NOTE. Radius may be added by placing a unit before the index of the logarithm for the double area, without the trouble of setting down the ciphers.

BY NATURAL SINES.

Divide the double area by the natural sine of the given angle, and that quotient by the given side ; the last quotient will be the side CN.

$$\begin{aligned} \text{Nat. sine of the angle at C } 60^\circ 20' &= 0.86892 \\ 6940 \div 0.86892 &= 7986.92 \\ 7986.92 \div -130.5 &= 61.2 \end{aligned}$$

From the above the following general rule may be drawn.

TO FIND THE SIDE OF A TRIANGLE WHEN THE AREA IS GIVEN, AND ALSO ONE OF THE SIDES, AND THE ANGLE CONTAINED BETWEEN THE GIVEN SIDE AND THE SIDE REQUIRED.

TO THE LOGARITHM OF DOUBLE THE AREA ADD RADIUS ; FROM THIS SUM SUBTRACT THE LOGARITHMIC SINE OF THE GIVEN ANGLE, AND FROM THE REMAINDER SUBTRACT THE LOGARITHM OF THE GIVEN SIDE ; THE LAST REMAINDER WILL BE THE LOGARITHM OF THE SIDE REQUIRED.

OR, BY NATURAL SINES : DIVIDE THE DOUBLE AREA BY THE NAT. SINE OF THE GIVEN ANGLE, AND THAT QUOTIENT BY THE GIVEN SIDE ; THE LAST QUOTIENT WILL BE THE SIDE REQUIRED.

CONCLUDING REMARKS.

Other methods of surveying fields are taught by some authors on this subject. The preceding, however, will be found most useful in actual practice. Other instruments besides those mentioned in this book are sometimes used ; such as the plain table, semicircle, perambulator, theodolite, &c. But of these instruments very little use is made in New England ; and they are not often to be met with. For general practice none will be found more useful than a common chain, and a compass upon Rittenhouse's construction. A surveyor should also provide himself with an offset staff, ten

links in length, and accurately divided into links. This should be made of firm hard wood, and will be found very convenient in taking offsets, and also in measuring the chain ; which should be often done, as from a variety of causes a chain is liable to become inaccurate.

It will be observed that in this work there are no descriptions of mathematical and surveying instruments. The compiler omitted such descriptions, from a belief that nothing which can be written on the subject will enable a person to understand them without an actual inspection of the instruments themselves, and some instruction from those acquainted with them.

The general principles here taught may be applied to the surveying of townships, roads, rivers, harbors, &c.

APPENDIX.

OF THE DECLINATION AND VARIATION OF THE MAGNETIC NEEDLE, AND OF THE ATTRACTIONS TO WHICH IT IS SUBJECT.

The declination of this needle is the number of degrees it deviates from the true north, either east or west. This differs in different places, and in the same place at different times. [At Hartford, Conn. the declination was, in 1829, $6^{\circ} 3'$ west of the true meridian of the earth; and was increasing by an annual variation of about $3'$.]

The following method of ascertaining the variation, by the north star, has been adopted by many surveyors, as the most eligible to be practised on land. It was communicated to the compiler by Moses Warren, Esq., of Lyme, an experienced surveyor, with permission to publish it.

The star commonly called the north star, is not directly north, but revolves round the pole in a small circle, once in 24 hours.* It can therefore be due north only twice in that period; and that is within a very few minutes of the time, when a star, called *Alioth*, in the constellation of Ursa major, or the great bear, is directly over or under it. There is also another star nearly in an opposite direction from the pole, called *Gamma*, in the constellation of Cassiopeia. When these three stars are vertical, the north star is very near the meridian; and when they are horizontal, it is at its greatest elongation, that is, at its greatest distance east or west of the pole, and on the same side as the star in Cassiopeia. The variation may be calculated when the star is on the meridian, or when at its greatest elongation; more accurately, however, at the latter period, because its motion being then nearly vertical for some

* More exactly, 23 hours, 56 minutes and 4 seconds.—ED.

time, gives the observer opportunity to complete his observation.[†]

To find the elongation of this star in any latitude, its declination must be known; that is, its distance north of the equator. This being found, institute the following proportion:

As co-sine of the latitude; is to radius; so is co-sine of the declination; to sine of the elongation.*

The declination of the north star, January 1, 1810, was $88^{\circ} 17' 28''$, and increasing at the rate of about 19 seconds and one half annually.

In the following table, the elongation is calculated for ten successive years, ending with 1840, and for seven different latitudes. The calculation is made for the first of July, and of course gives the mean angle for the year.

TABLE SHOWING THE ELONGATION OF THE NORTH STAR.

Years.	32°	34°	36°	38°	40°	42°	44°
1831	$1^{\circ} 52\frac{1}{2}'$	$1^{\circ} 55'$	$1^{\circ} 58\frac{1}{2}'$	$2^{\circ} 1\frac{1}{2}'$	$2^{\circ} 5'$	$2^{\circ} 9'$	$2^{\circ} 13'$
1832	$1 52$	$1 54\frac{1}{2}$	$1 58$	$2 1$	$2 4\frac{1}{2}$	$2 8\frac{1}{2}$	$2 12\frac{1}{2}$
1833	$1 51\frac{1}{2}$	$1 54$	$1 57\frac{1}{2}$	$2 0\frac{1}{2}$	$2 4$	$2 8$	$2 12\frac{1}{2}$
1834	$1 51$	$1 53\frac{1}{2}$	$1 57$	$1 59\frac{1}{2}$	$2 4$	$2 7\frac{1}{2}$	$2 12$
1835	$1 50\frac{1}{2}$	$1 53$	$1 56\frac{1}{2}$	$1 59$	$2 3$	$2 6\frac{1}{2}$	$2 11$
1836	$1 50$	$1 52\frac{1}{2}$	$1 56$	$1 58\frac{1}{2}$	$2 2\frac{1}{2}$	$2 6$	$2 10\frac{1}{2}$

The elongation for the latitude of the observation being calculated, or taken from the above table, proceed to find its range, according to the following directions;

Take a pole 18 or 20 feet in length ; to the end of it fasten a small line ; raise it to an elevation of 45° or 50° ; and support it by two crotches of suitable height to keep it firm in its place. At the end of the line near the ground, fasten a weight of half a pound or more, which should swim in water to prevent the air from moving the line. Southward of the line fix a compass sight, or other piece of metal or wood, with a narrow, perpendicular aperture at a convenient height from the ground, say about 2 or 2 1-2 feet ; and let it be so fixed that it can be moved a small distance east or west at pleasure. Let an assistant hold a light either NE. or NW. of the line, nearly as high as the range from the sight to the north star, in such a position that the line may be plainly seen ; then, (the three stars above mentioned being parallel or nearly so with the horizon,) move the sight-vane east or west, until through the aperture, the line is seen to cut the star ; and continue to observe, at short intervals, till the star is seen at its greatest elongation. Let a lighted candle be placed in an exact range with the sight-vane and line at the distance of 20 rods or more, which should stand perpendicularly, be made fast, extinguished, and left till morning. Then the sight-vane, the line, and the candle, will be the range of elongation, which observe accurately with a compass ; and if the elongation be east and the variation west, the former must be subtracted from the latter ; and if they are both west they must be added, and their difference or sum will be the true variation.*

OF THE ATTRACTION OF THE NEEDLE.

It is well known that any iron substance has an influence upon the magnetic needle, attracting it one way or the other upon the point where it would settle, were there no such attraction. A surveyor should therefore be careful to see that no iron is near the compass when taking a bearing. But as the earth in certain spots contains, near its surface, iron or other minerals, which attract the needle, it will frequently happen that it will point wrong. To ascertain whether this is the case, the surveyor, at each station, should take a back

* The author, in common with many writers, employs the term *variation*, as synonymous with *declination*. Variation is properly, however, the *change of declination*.—ED.

view of the one last left ; and if he finds that the compass does not reverse truly, he may be sure, provided the compass be accurately graduated and placed horizontally, that he either made a mistake at the last station, or that in one or the other or both of the stations, the needle was attracted from the true point. When he finds a place where he suspects there is an attraction, he should go a few rods backward or forward, and see whether the needle points differently. In this way he may prevent mistakes in his field notes, which would arise from putting down a wrong course. To take back sights is particularly necessary in running long lines, and laying out new lands, where the needle is the only thing to guide the surveyor.

By practice and experience a knowledge will be acquired on this subject, and with regard to many other things in surveying, which cannot be taught by books ; and after all the directions which can be written, the practitioner will frequently find occasion for the exercise of his own judgment.

A RULE TO FIND THE DIFFERENCE BETWEEN THE PRESENT VARIATION OF THE COMPASS, AND THAT AT A TIME WHEN A TRACT WAS FORMERLY SURVEYED, IN ORDER TO TRACE OR RUN OUT THE ORIGINAL LINES.

Go to any part of the premises where any two adjacent corners are known ; and if one can be seen from the other, take their bearing ; which compared with that of the same line in the former survey, shows the difference. But if one corner cannot be seen from the other, run the line according to the given bearing, and observe the nearest distance between the line so run, and the corner ; then work by the following proportion :

As THE LENGTH OF THE WHOLE LINE,
Is to 57.3 DEGREES,*
So IS THE SAID DISTANCE,
To THE DIFFERENCE OF VARIATION REQUIRED.

EXAMPLE.

Suppose it be required to run a line, which, some years ago, bore N. 45° E., distance 20 chains, and in running this line by the given bearing, the corner is found 20 links to the left hand ; what is the present bearing of this line ?

* 57.3 degrees is the radius of a circle (nearly) in such parts that the circumference contains 360.

$$\begin{array}{rcccl}
 \text{Ch.} & \text{Deg.} & & \text{L.} \\
 \text{As } 20 & : & 57.3 & : : & 20 \\
 & 100 & & 20 & \\
 \hline
 & 2000 & 1146.0 & & 60 \\
 & & & & \hline
 & 2000) & 68760 &) 34 \text{ Minutes.}
 \end{array}$$

Answer—34 minutes to the left hand is the allowance required, and the line in question bears N. $44^{\circ} 26'$ E.

The compiler of this work acknowledges himself under obligations to George Gillet, Esq., Surveyor General of the state of Connecticut, for the following illustrations, remarks, and miscellaneous questions, considering them calculated to be useful to the learner, and the practical surveyor.

PRACTICAL SURVEYING.

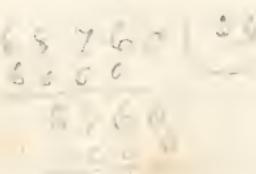

NO. I.

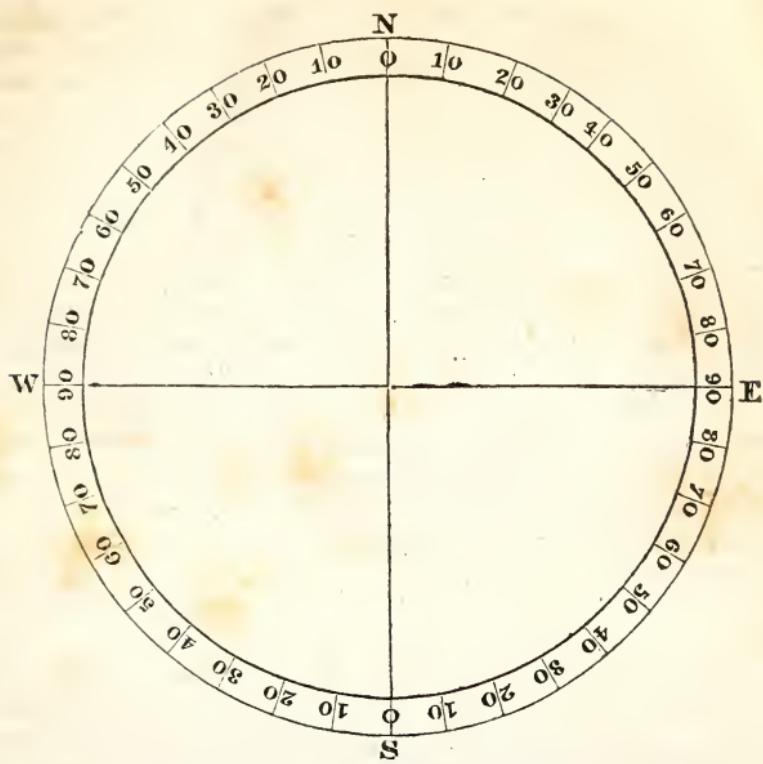

EXPLANATION OF THE COMPASS, WITH DIRECTIONS HOW TO USE IT, AND HOW TO PROVE THE ACCURACY OF IT.

In surveying, each angular point is considered the centre of a circle divided into 360 equal parts called degrees.

The circle is also divided into four equal parts, called quadrants, by north and south, and east and west lines crossing each other at right angles on the centre. Each quadrant is divided into nine equal divisions, and each division contains ten degrees.

The following figure represents the card, or the graduation of the compass.

At the centre is the pivot or centre-pin on which the needle turns. The compass is fixed on the head of a staff, and it may be directed to any object on any course whatever, while the needle retains its polarity. Courses are counted either east or west from their respective meridians. To be more explicit, the angle which a course makes with its meridian, is written north or south, so many degrees east or west.

Fix the above circle to the four cardinal points, and suppose your course runs from the centre through the point 40 to the right of N.; the direction of it is N. 40° E., or in the opposite direction S. 40° W. To take this course, turn the north end of the compass to the object at the terminating point of the line. This will turn the point 40 at the left of N. directly against the north end of the needle, then count the degrees from N. to the north end.

Suppose your course runs from the centre through the point 80 below W., the direction of it is S. 80° W., or in the opposite direction N. 80° E. To take this course, turn the south end of the compass to the object, and the point 80 above W., will be at the north end of the needle, and that at 80 below E. at the south end of it. In like manner, take all other courses.

In some compasses which are sufficiently correct for field surveying, when one end of the needle settles at any degree,

the other end will not settle exactly against the same degree on the opposite side. Even compasses of the first rate, when they are not well levelled, are liable to this error. Therefore, all courses should be taken from the *same end* of the needle, which may be the north end. For example, suppose your course is southeasterly or southwesterly, direct the compass to the object, and whatever degree the north end of the needle settles at, enter it in your field book, even if the south end differs a few minutes from that degree. Also keep the same end of the compass northerly and southerly on courses in that direction, and the same end easterly and westerly in the latter direction.*

By following these directions, the survey will be taken more correctly, than when the ends of the compass are frequently changed, and the northerly courses are taken by the north end of the needle, and the southerly courses by the south end of it.

When a needle is well magnetized, the inside of the cap smooth, and the centre-pin nicely pointed, the needle will traverse lively and long; but before it stops at the true point, will have an almost imperceptible tremulous motion.

When the needle settles quick, by giving the compass or the staff a light rap, it will commonly move a little, sometimes a quarter, a half, or a whole degree. This is certain evidence that something is out of order. Either the needle is not well magnetized, the inside of the cap is rough, or the centre-pin is blunt, which causes friction. The centre-pin ought to be as nicely pointed as a fine sewing needle. Whether the compass is in order or not, the rap should be given after the needle has settled.

The centre-pin is the part of a compass which fails first. The point is easily broken or blunted, and is always in danger. When the point is injured, it is not easily renewed so as to be equal to its first state. Therefore, too great care cannot be taken of a good compass.

When a new compass is procured, it may be recommended to have one or more extra centre-pins with it, that when one fails another may be in readiness.

To prove the accuracy of a compass, set each end of it to some distant object at every ten degrees around the circle. If, in every instance, each end of the needle settles at the same degree on the opposite side, the compass is accurate, and is of the first rate; but if there should be found a difference of five minutes on a part or around the whole circle, the compass would be considered as one of the second rate, and by following

* This practice has been recommended by the most celebrated mathematical instrument makers.

the foregoing directions, a survey might be taken with it to a good degree of accuracy.

A compass which does not come within one or the other of the foregoing descriptions, ought not to be used on valuable land.

When a compass is not in use, it should be placed where it can have no motion, and the needle should be left on the centre-pin. By keeping its polarity, the magnetic power of the needle will strengthen rather than weaken.

Compasses differ in their directions. Those of the first rate have been known to vary within the space of a quarter or a third of a degree, when no defect could be discovered in the mechanical part of them. As correct a survey may be taken with one as with another of this description. The question then naturally arises, which of these varying compasses is right? The answer is, all are right; neither of them points directly to the poles of the earth, except on a line of no declination. Each compass will find such a line. All that can be said of them is, that one makes a greater declination than another, and that which makes the least, cannot have the preference. It has also been ascertained that different needles do not point alike at the same place. French writers on magnetism have treated on this subject.

It was well known to the celebrated Rittenhouse that his compasses did not agree, and he was never satisfied as to the cause of it. To remedy this defect, if it can be called a defect, he constructed his compass with a nonius or a vernier scale (as some term it), that all of them might be so regulated by a meridian as to agree. The meridian should be established by the motion of the heavenly bodies, and made permanent by durable monuments. All courses which are matters of record ought to be taken from the true, instead of the magnetic meridian. Such meridians should be established at convenient distances from each other, so that whenever a survey is to be taken in the vicinity of one of them, a surveyor might set his compass on it and note the declination found, and that declination, together with the meridian from which it was taken, should be inserted in the deed, or instrument by which the land is conveyed, and should be a part of the record. This would assist a surveyor at any future period in retracing those lines, by setting his compass on the same meridian, and allowing the difference in declination since the preceding survey. This would tend greatly to the security of landed property, and it is the only method by which magnetic courses can be regulated. Without this regulation, one correct compass may be used to as good advantage as another. So Dr. Rittenhouse viewed

the matter: so the common practice of the country has established it.

NO. II.

ON THE IRREGULARITIES OF THE MAGNETIC NEEDLE.

By a statute of this state, applicants for the appointment of county surveyor, are required to be well skilled in point of science in the *theory* of the most approved method of surveying lands. It is also as necessary that they should be as well skilled in *practical* surveying. Practical knowledge must be acquired by experience, but no one can have a thorough knowledge of correct practice without being acquainted with the imperfections of the magnetic needle.

It is supposed by most people, that this instrument, in all places, points directly to the poles of the earth, and that its direction remains as permanent as the poles themselves; an infallible guide.* This is a mistaken idea. A few remarks on this subject will here be offered, and some facts respecting it stated.

* There is one line around the globe on which there is no declination. The general course of this line on this side of the globe is from northwest to southeast, but it is crooked and irregular in its course. This line is not stationary, but is ever changing its position, and notwithstanding the great variety of its directions, it never crosses itself. According to Dr. Holly's chart, made in 1700, this line crossed the meridian of London in 55° south latitude, crossed the equator in 17° west longitude; from thence by various windings to the island of Bermuda; from thence nearly a west course until it struck the continent near Charleston in South Carolina.

About 1756, another chart was made, when the line had fallen so far to the west, that it struck the continent near the coast of Florida. On the east side of this line, the magnetic needle points to the west of north, and on the west side it points to the east of north, and a regular increase of either east or west declination is found from it on its opposite sides.

The line of no declination now runs through the state of Pennsylvania, and through the eastern part of Virginia.

At New Orleans, in 1813, the declination was east about eight degrees. The same year, an article appeared in a Philadelphia paper, from which the following was extracted.

At Philadelphia, "1701, declination $8^{\circ} 30' W.$; 1793, $1^{\circ} 30' W.$; 1794, the needle was observed to recede to the west; 1804, $2^{\circ} W.$; 1813, $2^{\circ} 27' W.$ "

According to observations made at Albany by the Surveyor General of the State of New York, the needle, for many years past, has declined to the west. The observations of Mr. N. Goodwin, of Hartford, (Con.) agree with those of the Surveyor General of New York.

In 1805, the writer commenced a series of observations at Hebron in Connecticut, which have been continued to the present year (1832), and during that period the needle has declined to the west, a degree or more, and the west declination is still increasing.

Notwithstanding the utility of the magnetic needle, it cannot be relied on when great accuracy is required, on account of the irregularities to which it is subject, viz. its annual and diurnal variations, and what is the cause of still greater perplexity, its local attractions. When an old course is given to renew a line, it cannot be depended on, on account of the change in declination, between the time of the first running and the renewal of it.

No annual rate can be fixed on as a certain rule for the declination of the needle, as its motion is much more rapid in some years than in others. By observations made at London during a period of more than two hundred years, it appears that in some years the motion of the needle was rapid, in others, but little could be discovered, and, in some years, the motion was retrograde. There is no regularity in its motion at any place for any length of time.

The *diurnal* motion of the needle has long been known. As the sun rises in the forenoon, it has an effect on the unknown something which gives polarity to the needle, and turns the north end of it to the west. In the afternoon and night following, the needle returns to its position. Observations for the diurnal motion have been made in abundance, both in Europe and America. The result on both continents has been

While at so many places in the northern states, and at many more which might be mentioned, the west declination has increased, at Salem in Massachusetts, according to the observations of Dr. Bowditch, it has steadily decreased.

In 1580, at London, the magnetic needle pointed eleven degrees and a half to the east of north, which proves that the line of no declination was then east of that place.

The east declination diminished until 1657, when the line of no declination arrived there and passed by; of course west declination commenced, and at the close of the last century, it had increased to twenty-four degrees.

The line of no declination must have made rapid progress through the Atlantic and through a great part of the United States, to have arrived at Charleston in 1700, and at the coast of Florida in 1756.

It is unaccountable how the west declination at London should increase, while at Philadelphia it diminished, when both places were on the same side of the line of no declination.

The mystery is solved with equal difficulty, how the west declination at Salem should diminish, while at Philadelphia, Albany, and at Hartford it increased. The declination of the needle has long been a subject of much perplexity. Observations have been made in abundance. Many facts have been ascertained, but they are not reducible to system.

The polarity of the needle, with its variations and irregularities, is a hidden mystery, which is never to be searched out by man. It is sufficient in itself, without any other evidence, to cause the reflecting mind to wonder at, admire and adore the wisdom, knowledge and power of HIM, who planned and who still directs it.

nearly the same. In summer, about a sixth or a quarter of a degree is usually found. In winter, but very little can be discovered. Perhaps, in a hot climate, the diurnal motion may be greater.

Local attraction is found oftener in hilly, broken lands, filled with ledges, than in level, feasible land, where there are no ledges. As the sources of attraction are generally unknown and are out of sight, their situation should be determined by experiment. They sometimes cause the needle to deviate more than a degree, and often occasion a more trifling inaccuracy. In some instances, differences have been found, of more than five degrees within the distance of forty rods.

Although the magnetic needle is not that infallible guide which most people suppose, yet it is a very useful instrument, and, in our country, cannot be wholly dispensed with in land surveying; but the surveyor who is best acquainted with it, will make as little use of it as he can.

NO. III.

ON PRACTICAL SURVEYING.

Surveying is a branch of business which will admit of diligence, but it will not bear to be hurried. Sufficient time must be allowed to take courses, measure distances, and to make calculations correctly, even if the employer *does not see the necessity of being so particular*.

In taking a survey, go around *with the sun*, or keep the land which you survey on your right hand, not that you can work more correctly, or that it will have any effect in plotting or in calculating, but when you put your courses and distances on your map, they will follow around from the left to the right, as you perform any other writing, and your map will appear to better advantage than when you write against courses and distances.

Wherever you begin, set your compass on the first angle, and cause a stake or a flag-staff to be erected at the next.

If the first bound is a rock, erect a stake on it, and set your compass any where between the two stakes, or you may go back of the first angle and take the range of the stakes.

When the boundary line is not straight, place the flag at the first angle, and go forward to a convenient place for the next, and take your course by a back sight.

When a line is of such a length that you cannot see the end, and do not know the exact direction of it, leave a flag at the beginning, and go forward as far as you can have a fair view

of it, and set your compass to the flag. Pursue that course to the end, and if you shall strike the bound, you need not boast of superior skill, for it was by chance or accident. A line ran in this manner, is commonly termed a *random* line.

When the course of a random line is not in a direction to the bound, continue it to a point from which, by turning at a right angle you will strike the bound, then measure the distance from the end of the random line to the bound, and this distance and the length of the random line will be the legs of a right angled triangle, the hypotenuse of which will be the true distance, and the bearing of the hypotenuse, the true course.

When the course of a random line is northwesterly or south-easterly, and it strikes to the right of the bound, the angle formed by the true and the random line must be added to the course of the latter, but if to the left, it must be subtracted.

When the random course is northeasterly or southwesterly, and it strikes to the right of the bound, the angle must be subtracted, but if to the left, it must be added.

When a line crosses a hill, cause a stake or flag to be erected at each end of it, and set your compass on the top of the hill, directly between them. If bushes or a hedge obstruct the sight on the line, make an offset at each end, or take the course by a random line.

When a distant tree near the line can be seen at the beginning of it, the bearing of the tree may be taken, and the distance measured, and from the tree to the bound, and the bearing of the bound from the tree may be taken by a back-sight, and the course and distance may be calculated by a traverse.

EXAMPLE.

Suppose from the beginning of a line, a tree bears N. 5° W. and the distance is 50 rods; from the tree to the end of the line, is N. 5° E., 50 rods, the course of the line is north, and the distance is 99 rods and $15\frac{1}{2}$ links.

When a line crosses water which cannot be measured with a chain, cause a stake to be erected on the opposite side, directly in the line. Then turn from the line at right angles, and measure until the course on which you ran from the line and the bearing of the stake, form an angle of 45° , then the distance from the angle to the point of turning off, and from that to the stake will be precisely the same, which may be added to the distance already found.

If it is not convenient to measure so far as to form an angle of 45° , stop at any proper distance and take the bearing of the stake, and having ascertained the angle, calculate the dis-

tance across the water by the following proportion. As the sine of the angle at the stake : is to its opposite side :: so is the co-sine of that angle : to the side required.

EXAMPLE.

Suppose the bearing of the stake is N. 84° W., you may turn to the right or to the left, if to the former, your course will be N. 6° E., and if you measure 16 rods and then take the bearing of the stake, which may be S. 74° W., the angle at the stake will contain 22° . State the question as follows:

16 rods	-	-	-	1.204120
Co-sine of 22°	-	-	-	9.967166
				11.171286
Sine of 22°	-	-	-	9.573575

Distance across the water 1.597711 39.6 rods.

If it is not convenient to turn from the line at right angles, turn at an acute or an obtuse angle, measure a suitable distance, take the bearing of the stake, and calculate the distance by oblique trigonometry.

EXAMPLE.

Suppose, on the same line you turn and run N. 27° W. 15 rods and 3 links, the stake on the opposite shore will bear S. 74° W. The angle at the stake will contain 22° , that at the point of turning from the line, 57° , of course the other angle will contain 101° . In this case, all the angles and the side opposite to that at the stake, are given. The distance across the water may be calculated by the first case of oblique trigonometry.

When a line crosses a ledge too high and too steep to be measured with a chain, whether the ascent or descent is before you, erect a flag at the top of it, take a station at the bottom, and ascertain the distance by the method of ascertaining it across water, which will give the base of the hill from your station to a point directly under the flag.

In taking courses, on account of local attractions, the compass should be set at least twice on each line, even if you have a fair view of the whole length of it. Should there be a difference in the traverse of the compass at the two places, a third should be selected. Should the compass traverse alike at two places, the surveyor may conclude that he has found the true course, but when no two places are found where the compass has the same traverse, the surveyor should enter

a medium course in his field book, noting such courses, as he may still have occasion to correct them in his calculation.

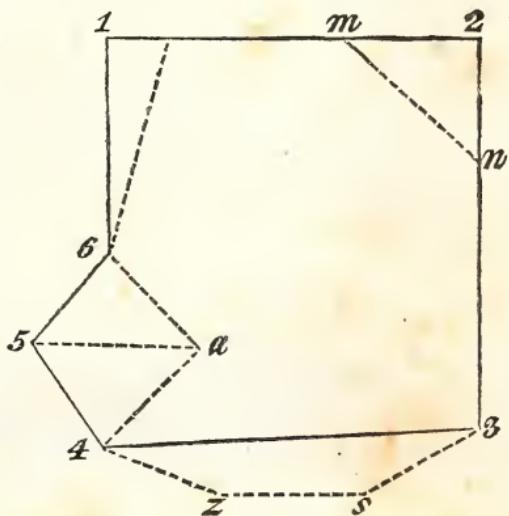

If in such cases, he is at a loss what course to enter in his field book, and suspects that some minutes may be added to, or subtracted from the course which he enters, he should prefix to such courses the sign of addition or subtraction, as the case may be, which will often assist him in balancing his surveys. It would be no easy matter to describe all the different methods which may be selected in different cases, in taking the field work of surveys. An example of only one case will be given here, which is represented by the following figure.

The survey was begun at the corner numbered 1. The corner numbered 2, was in a pond. The course and distance were taken from 1 to m ; then from m to n . The angle at 2 was a right angle; of course there was a right angled triangle, wherein the angles and hypotenuse were given to find the sides $m2$ and $2n$. From n to 3, the course and distance were taken on the line.

The next line ran through a thicket in a swamp. Courses and distances were taken from 3 to s , thence to z , thence to 4, and the course and distance of the line 3—4 were calculated by a traverse from those courses and distances. At the angle 5, a tree stood on a high clump of rocks, inaccessible on either line terminating at that point. The course from 4 to 5 was taken at 4. Next, the course and distance were taken from 4 to a , and from a , the course was taken to 5. Next the course and distance were taken from a to 6, and from 6 the course was taken to 5. Two oblique triangles, with the angles and one side in each, were given, to find the sides 4—5 and 5—6, which give the base of the hill.

The closing line ran through thick bushes and water, and the course and distance were taken on the dotted line to the line 1—2, at a point twenty rods from 1. The course and distance of 6—1, were calculated accordingly.

Whenever a line runs through or over a place where it is difficult to take either course or distance correctly, if, by taking

a traverse around, at a little distance from the line; the surveyor can have level, cleared land, and then calculate the true course and distance from the courses and distances of the traverse lines, he will be more likely to ascertain the correct course and distance than he would by attempting to run on the line. By practice and experience, a method for taking courses and distances, in all cases, will become familiar.

In a hilly country, the two-pole chain is preferable, and is more commonly used, because it can be better levelled.

In measuring hills and inclined surfaces, the horizontal distance must be taken. A plummet should be suspended from the end of a chain when it is levelled.

When hills are very steep, the surveyor should assist the chainmen, and when the best is done in levelling and plumbing the chain, judgment must frequently be called into exercise.

Even when elevations and descents are easy, there is danger of making too much measure. In such cases, chainmen often make allowances, but the surveyor will do better to keep them to close measure, and from the shape of the ground, judge what allowances ought to be made. An experienced, judicious surveyor, will form a more correct judgment in such cases than inexperienced men.

If a surveyor is acquainted with the rise or descent of hills, the traverse table will aid him. For example, from the surface of a hill which rises on an angle of five degrees, one link for every ten rods may be deducted.

Particular care must be taken to have the chain carried on a straight line. When a *tally* is ended, and the hinder chainman carries forward the sticks, they must be counted. When on counting the sticks it is discovered that one is lost, the chainmen should not leave the chain and go back to find it, but, from the last mark, should *measure* back to the point where the tally began, to see whether the full tally was measured, or whether one chain was lost from it. Many blunders have been left undetected by not taking this care. A careful accurate chainman never loses a stick or miscounts a tally.

Distances may be taken by chains and links, or by rods and decimal parts, as best suits the surveyor. When a survey is calculated by chains and links, the numbers by which the process is performed, are smaller than when it is calculated by rods and decimal parts. Every method by which the numbers are diminished, is an improvement.

Young surveyors should practise much for their own instruction, and should make correct practice familiar, before they offer their services.

A young surveyor should bear in mind that if he is detected in one error in the beginning of his practice, it will be more to

his disadvantage than to be detected in two, when he shall become well established. If an error is committed in a survey, it is not against the surveyor, provided he detects and corrects it, but if he cannot do this, it is sufficient evidence of his deficiency in point of knowledge and skill.

NO. IV.

DIRECTIONS FOR RUNNING AND ESTABLISHING LINES.

Many people suppose that a surveyor at the beginning of a line, by intuition or by some magic art, can set his compass directly to the terminating point, whatever obstructions may intervene, and that he needs no assistance ; but this is a mistaken idea.

In running a line of considerable length, a surveyor should have two assistants to carry the chain, two to carry flags, in whose ability and correctness he can confide, and a fifth to carry an axe. If the surveyor is not furnished with such a number of assistants, his employer need not place too much confidence in his work.

The flag staves should be as much as two and a half or three inches in diameter, or what would be better, two strips of a board of that width, and seven or eight feet in length. If they are not so wide, they cannot be seen through the sights of the compass at any great distance. On one end of each staff, a flag, either white or red, of a yard in length should be wound tight, and not left to hang loose and flutter in the wind. The latter color will be more clearly seen through bushes, especially when the ground is covered with snow, and the brighter the color the better. Being thus manned and equipped at the beginning of a line, he must set his compass as near the true line as he can, or, he may set up one of the flags at the place of beginning, and go forward as far as he can have a view of the back flag. There set his compass on the random line, and send the other assistant as far forward as he can conveniently see the flag. When each flag is clearly seen through the sights of the compass, the back flag must be brought forward, and placed where the compass stood. In this manner he must proceed on his random line, taking care each time he sets his compass, to turn the sights to the back flag. Great care must be taken to keep the flags perpendicular ; also, the surveyor must keep the staff and the sights of the compass perpendicular. A little leaning of the flags, or turning the sights of the compass from a perpendicular, will make a crooked line. In taking his sights to the flags, he must look as near the ground

as he can, and when practicable, the flag should be turned downwards, on account of the danger of being leaned when kept up.

All obstructions, such as bushes, brush, &c. must be cleared away. The random line must be measured, and at convenient distances, perhaps at every twenty rods, stakes must be set directly in it. Every stake must be numbered, that no mistake may be made in calculating, when they are afterwards removed and placed on the true line. If, in the course of the random line, the needle does not traverse as at first, or traverse alike at different places, no regard must be paid to it, the flags must direct the course; neither should the surveyor be turned aside or terrified by the cry of either of the parties, *you are wrong, you are wrong*, (for he will most certainly hear it,) but he must continue his random line, until turning at right angles, either to the right or to the left, as the ease may be, he can exactly strike the bound, or the point where a bound is to be erected; there he may stop, and measure the distance from that place to the bound. He may then calculate the course and distance of the true line, as before taught, but for setting the stakes in the true line, he may take the following directions.

Suppose the whole length of the random line is 200 rods, and the distance from the termination of it to the bound is 90 links, the calculation for setting the stakes on the true line may be made thus:—As the whole distance : is to 90 links :: so is the distance of any stake : to the distance that such stake is to be moved.

If the stakes are 20 rods apart, the answer is, the first stake is to be moved nine links, the second 18 links, and so on, adding nine links at each stake, until the whole are moved at right angles from the random, to the true line. Many crooked lines and consequent disputes between farmers, have arisen from the want of this care and attention. When a long line is to be run over a number of ridges, and across intervening vallies, it should first be run and established from one ridge to another, and the intermediate spaces in the vallies may be taken afterwards. By taking long sights there will be less danger of turning from a straight line.

In all cases, the forward flag should be carried as far as it can be distinctly seen, unless it is at the termination of a line.

On account of the irregularity of the magnetic needle, the difference between compasses, and the incorrect manner in which most of the former surveys were made, no rule can be given which may be relied on, with certainty, in renewing lost bounds. In such cases, the best evidence must be taken which can be produced. When an old line is to be renewed, where the bounds have been lost, the surveyor may verify or

prove his accuracy in various modes. If he finds, for example, that the lots on each side of the line contain their due quantity, or possess their full width, he will have reason to believe that the line is accurately run: if not, he may allow for the excess or deficiency in either of these lots, and thus discover the true position of the line.

It would be difficult to mention all the circumstances which may govern, or which may serve as evidence in such cases.

No. V.

ON BALANCING SURVEYS.

In every survey which is taken without an error, either in courses or in distances, the sum of the northings will equal that of the southings; and the sum of the eastings, that of the westings; but this is not always an infallible proof that the survey is accurate, for *two* errors may be committed, one of which will exactly balance the other, which no rule will detect; but such cases do not often occur.

In practical surveying, it is next to an impossibility in any case, to work so correctly that the survey will exactly close without some correction. The difference between the two columns of latitude, and between those of departure, are the legs of a right angled triangle, the hypotenuse of which will be the distance which the survey will fail of closing. In a survey of one hundred acres, whatever may be the number of the angles, the difference between the two columns of latitude and the two columns of departure, ought not to exceed a rod for each, but to come within those limits if possible.

If, in such a survey, either of the differences should exceed a rod, where the land is valuable and easily surveyed, it would be better to take a re-survey, or so far as to detect the error.

These differences, as before taught in this work, must be balanced before the column of meridian distanced can be formed, or a correct plot of the survey be drawn.

The small differences between the columns in surveys which are substantially correct, commonly arise from an excess of measure, on account of the irregularity of surface, and from errors of the compass, caused by local attraction, and diurnal motion.

Some authors have given rules for balancing surveys, which are indiscriminately applied to every line in the survey, which presupposes that a proportional error must have been committed on each and all, both in courses and distances; when

in almost every survey, a part of the lines are on land so level and so clear from obstructions of any kind, that if the surveyor and chainmen attend to their business, they will not be likely to commit much error on them ; while other lines on other parts of the same survey are attended with so many difficulties, that when they have done their best, it will scarcely be possible for them to avoid some error, and the surveyor who takes the survey will best judge on what lines the errors were committed, and whether they were in the courses or in the distances. In all cases, the corrections should be made on the lines containing the errors.

When the errors are in the courses, they should be corrected, and when the errors are in the distances, the correction should be in them, or the correction may be in both courses and distances, as the surveyor may judge proper.

Surveys are commonly balanced by subtracting half the sum of the differences, from the numbers in the larger columns, and by adding them to those in the less.

This, in most instances, is a correct method, but in certain cases, there are exceptions to it. For example, the boundary lines of three sides of a farm are on level land where there are no obstructions. The other side is on rough land filled with broken precipices. In such a case, most, if not all the correction, should be on the lines on the rough side. In some instances, most of the error may be in the course of a single long line.

It is not uncommon on high hills that the traverse of the needle differs a quarter or a half of a degree or more from its traverse in valleys and on plains below. In such cases, courses should be corrected. In general, the compass is subject to more error than the chain. As rules cannot be given for correcting surveys in all cases, this must be left in a great measure to the judgment and experience of the surveyor.

As a general rule, corrections should be made principally on long lines, and the corrections may be in proportion to the difficulties with which the surveying of them is attended.

When a course is north or south, or east or west, or near either of those points, a few minutes may be added to it or subtracted from it when necessary to favor the balancing. If the distance is of considerable length, it is probable that the course may contain some error.

When a course is nearly equidistant between any two of the four cardinal points, if the correction of it increases the latitude and diminishes the departure, or if it diminishes the latitude and increases the departure so as to favor the balancing, there is double evidence that the course contains some error. If by diminishing the distance on such a course, both

the latitude and departure are so diminished as to favor the balancing, it is good evidence of an excess of measure.

In correcting surveys, there is less danger from diminishing distances than there is from increasing them. Cases may occur in which distances may be increased, but the surveyor should be very cautious about it.

No. VI.

ON RECTANGULAR SURVEYING.

Rectangular surveying* is a name given to the method here treated of by the late Governor Treadwell.

In the operation of it, the whole survey is reduced to squares and parallelograms, and each of these figures is divided into two right angled triangles of equal shape, or into two trapezoids of equal size and shape, by a boundary line of the field running obliquely through it, except when the boundary line is directly north and south, then the figure is divided into two squares or parallelograms.

The calculations are made from a meridian drawn, either at the eastern or at the western extremity of the map; and the areas are produced by multiplying the latitudes by the longitudes made from this meridian.

All the spaces lying between the field and the meridian, and between the parallels of latitude of the northern and southern extremities of it, also large spaces lying without the figure on the opposite side of it, and between those parallels, are included in the calculation; but that which lies without, is eventually excluded.

Parallels of latitude are drawn from each angle to the meridian, which are called meridian distances.

In forming the column of meridian distances, when the meridian is drawn at the eastern extremity, the westings are added, and the eastings subtracted; but when the meridian is laid on the west side, the eastings are added and the westings subtracted.

The meridian distances proceeding from each end of a line are added together, to form the column of double mean distances, which the compiler of the foregoing work called second departure.

Meridian distances and double mean distances,† are more

* Rectangular calculation is as proper.

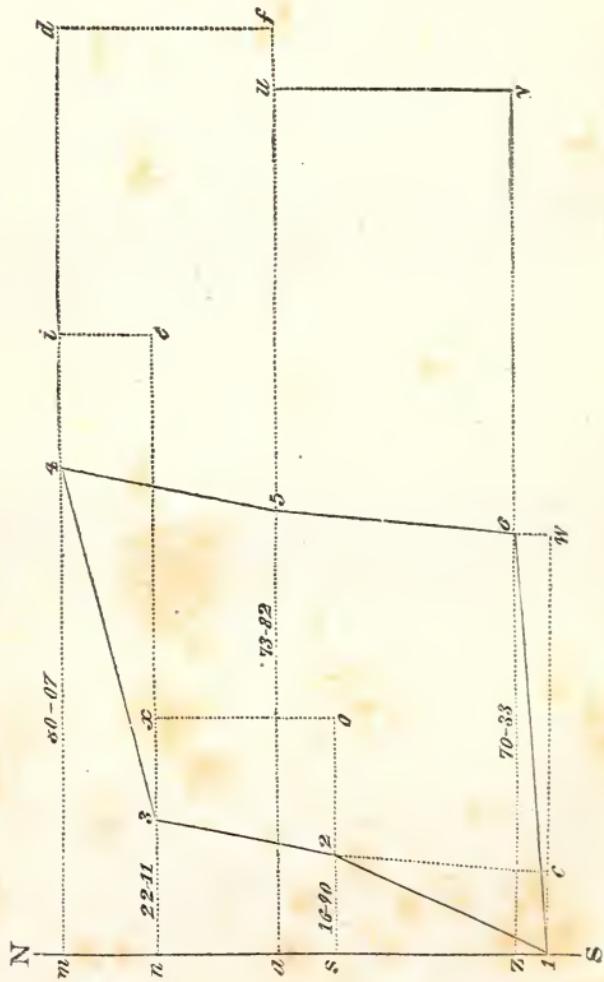

† The compiler of the foregoing work would have made use of these names, but he was afraid of infringing on a certain copy-right which has expired.

proper terms or names for these columns, than first departure and second departure.

The meaning of the term meridian distance, is the distance made from any meridian.

The following survey is calculated from the meridian of the first station which is on the west side of the figure, of course, the eastings are added and the westings subtracted.

The whole is illustrated by this figure.

APPENDIX.

Area in rods

160)4135.665

To form the first column, marked at the top Merid. Dist. set the easting of the first line 16.90, into the head of the column, which is the meridian distance of 2, or the distance from 2 to 8. To this number, add the easting of the second line, and their sum is 22.11, the meridian distance of 3, or the distance from 3 to n. To this number add the easting of the third line, and their sum is 80.07, the meridian distance of 4, or the distance from 4 to m. From this number, subtract the westing of the fourth line, and 73.82 remains, the meridian distance of 5, or the distance from 5 to a. From this number, subtract the westing of the fifth line, and 70.33 remains, the meridian distance of 6, or the distance from 6 to z. From this number, subtract the westing of the closing line and 00.00 remains, which proves the work correct so far. When the last subtraction does not end in a cipher, an error has been committed somewhere.

In forming the column of double mean distances, take the following directions:—

Add together two opposite sides of each figure formed by the meridian distances. Set the first meridian distance into the head of the next column, or that marked at the top D. M. D., and it gives one side of the parallelogram 1s—2c. This figure is divided into two equal triangles by the line 1—2. The meridian distance multiplied by the northing of the line 1—2, gives the area of the whole parallelogram, or the double area

of one of the triangles. Let this be considered, that which lies without the field. To the line 2s, add 3n, and their sum is 39.01, the length of the parallelogram *nwos*, which is divided into two equal trapezoids by the line 2—3. The double mean distance 39.01, multiplied by the northing of the line 2—3, gives the area of the parallelogram, or the double area of one of the trapezoids.

Let this be considered that which lies without the field. To the line 3n, add 4m, and their sum is 102.18, the length of the parallelogram *mien*, which is divided into two equal trapezoids by the line 3—4. The double mean distance 102.18, multiplied by the northing of the line 3—4, gives the area of the parallelogram, or the double area of one of the trapezoids. Let this be that which lies without the field. To the line 4m, add 5a, and their sum is 153.89, the length of the parallelogram *mdfa*, which is equally divided by the line 4—5. The double mean distance 153.89, multiplied by the southing of the line 4—5, gives the area of the parallelogram, or the double area of one of the trapezoids.

Let this be that which abuts on the meridian, being partly within and partly without the field.

To the line 5a, add 6z, and their sum is 144.15, the length of the parallelogram *auwz*, which is equally divided by the line 5—6. The double mean distance 144.15, multiplied by the southing of the line 5—6, gives the area of the parallelo-

gram, or the double area of one of the trapezoids. Let this be $a_5 - 6z$, partly within and partly without the field. To the line $6z$, nothing is to be added, of course, it is one side of the parallelogram $z_6 - w_1$, which is equally divided by the closing line. The distance 70.33, multiplied by the southing of the closing line, gives the double area of the triangle $z_6 - 1$, partly within and partly without the field.

The three products in the column of north areas, all lie without the field. Those in the column of south areas lie partly within and partly without the field, and they include all the space which is covered by the products in the column of north areas.

Hence it is plain, that when the sum of the former is subtracted from that of the latter, the double area of the field will remain. In this method, when the column of meridian distances and that of double mean distances are correct, the sum of the latter will be double to that of the former.

PENNSYLVANIA METHOD.

If the writer has been correctly informed, this improvement was made by Dr. Rittenhouse.

Only one column is used for meridian distances, but the final results are the same as when two columns are used.

This method is not so easily explained to the learner, but is perhaps preferable in practice, because an error may be committed in forming the column of double mean distances, which may not be discovered, but in this method, an error cannot be committed in the meridian distances, without being detected. A full explanation of this method would be tedious and perplexing to the learner, without being of the least use in performing practical operations, and probably, if made, but little attention would be paid to it, therefore, only directions how to form the column and how to apply the numbers in their practical use will be given.

The operation of this method is substantially the same as that of the other, and the diagram given in that will answer for this. The north and south products are precisely the same in both methods. A further investigation of this method will be left for the learner when he shall be more experienced.

When the two columns in the other method are proved by addition, the process is longer than in this.

The second column in the foregoing example, marked at the top, meridian distances, is the method here treated of.

To form the column, add twice or subtract twice against each station. Set the first easting 16.90 into the head of the

column at the upper place. Add it to itself, and the sum is 33.80 in the lower place. To this number add the next easting, and they make 39.01 in the upper place. To this number add the same easting again, and they make 44.22 in the lower place. To this number add the third easting, and they make 102.18 in the upper place. To this number add the same easting again, and they make 160.14 in the lower place.

From this number subtract the first westing, and 153.89 remains in the upper place. From this number subtract the same westing again, and 147.64 remains in the lower place.

From this number subtract the second westing, and 144.15 remains in the upper place. From this number subtract the same westing again, and 140.66 remains in the lower place. From this number subtract the last westing, and 70.33 remains in the upper place.

From this number subtract the same westing again, and 00.00 remains. The upper number against each station in this column, is the same as the double mean distance which stands against it; and the remainder of the process may be performed as before directed. Another column may be formed as the eleventh in this example, marked H. D. at the top, which, for distinction is here called half distance. This column is the same as that of Gibson's half departure. It contains half the sum of the numbers in the double mean column. These numbers, when multiplied by their respective northings or southings, give the simple areas of the different figures.

This method is preferable in practice, as the multiplications are greatly diminished. When the last decimal in the double mean distances is an odd number, a unit may be taken off, and take half the remainder, rather than annex another decimal: perhaps this would not make the difference of a rod in a survey of three hundred acres. Or the odd numbers in the last place of decimals may be balanced by sometimes adding a unit.

If the numbers *are* diminished a trifle, it may be remarked, that, on account of uneven surfaces, there is danger of making the distances too much, rather than falling short of the true measure. There are other methods by which surveys may be calculated arithmetically, but none are more correct, and perhaps none are so simple and so easy to be understood as the methods here treated of. These methods may be applied in every case in practical surveying which depends on a calculation from courses and distances.

Instead of laying the meridian on one side, it may be laid through the map, either at an angle or so as to bisect a boun-

dary line; but this renders the process more complex and difficult.

No. VII.

ON PLOTTING SURVEYS.

Surveys may be plotted by various methods. That which is commonly practised, is by a scale and protractor.

The latter instrument is a semicircle graduated like the compass, and it answers the same purpose in laying angles on paper, that the compass does in taking them in the field.

A meridian is drawn for each station or angle in the survey, and the angle which each course makes, with its respective meridian is laid down with the protractor, and each distance by a scale of even parts. It would be well also to draw a parallel of latitude for each station, as by such parallels the protractor may be kept more truly to the meridians.

A plot may be drawn by laying down the angles by the protractor without meridians or parallels of latitude, as has already been taught in the foregoing work; but the writer never had so good success by this method as he has had by laying his courses from meridians.

As the scale and protractor are equally subject to error, the surveyor will be more likely to draw a correct plot if he should dispense with the latter instrument, and lay down the boundary lines from the latitude and departure of each, or from the latitude and meridian distance of each angle.

To plot from the several latitudes and departures, take the foregoing survey for an example.

As that survey is small, take half a sheet of paper and draw meridians across each end of it.

On the left hand meridian, make a point for the beginning. From that point draw a parallel of latitude to intersect the other meridian, perpendicular to, or at right angles with each.

The latitude of the first course is 36.25. Draw another parallel of latitude at that distance above the first.

The latitude of the second course is 29.54. This, added to the first, makes 65.79. Draw another parallel at this distance above the first.

To the sum of the first and second latitudes, add that of the third, and their sum is 81.32. At this distance above the first, draw another parallel. The southing of the fourth course is 35.54. Subtract this from the whole sum of the northings, and 45.87 remains. At this distance above the first, draw another parallel. From the last remainder, subtract

the southing of the fifth course, and 6.02 remains, which is the southing of the closing line. At this distance above the first, draw the last parallel. In like manner, draw the meridian of each station, according to the departure made on each course. The intersection of these lines will be the angles of the figure. If the distances shall not exactly fall into these points, the process will contain some error, either in drafting or from a scale not accurately divided.

TO PLOT FROM LATITUDES AND MERIDIAN DISTANCES.

First, form the column of meridian distances. Next, draw the meridian of the first station, and the several parallels of latitude as before directed. On these parallels, lay the meridian distance of each station, viz.—from *s* to *2*, 16.90 ; from *n* to *3*, 22.11 ; from *m* to *4*, 80.07 ; from *a* to *5*, 73.82 ; from *z* to *6*, 70.33.

From one of these points to another draw the boundary lines. Great care must be taken to keep the latitudes parallel and perpendicular to the meridian. The scale must be correctly divided, the dividers nicely pointed, and the rule must be straight. Whether the protractor is used or not, before a plot of a survey is drawn, it should be balanced, and both courses and distances corrected according to the balancing.

The following example is given as a proof of the necessity of balancing a survey before the map is drawn.

A farm is to be divided among a number of heirs. A survey of it is taken, and the difference between the two columns of latitude, and between the two columns of departure, is two rods for each. The survey is balanced and calculated arithmetically, and is found to contain two hundred acres.

The surveyor next draws his map, by which the divisions are to be made, according to the courses and distances as they were taken on the ground. The plan does not close by nearly two rods and three quarters. He next corrects the lines, and makes the map close as well as he can ; and when the divisions are made, they may not agree with the first calculation, by two or three acres or more. Should the map be drawn as before directed, by the latitudes and departures as balanced, or by the latitudes as balanced and the meridian distances, it would close, and would be in exact conformity to the calculation made arithmetically. If the divisions are made arithmetically, the calculations must be made according to the balancing, or the divisions will not agree with the first calculation.

When a map of a multangular piece of land of very irregular shape is to be drawn, whether a calculation or a division is to be made from it, the surveyor should measure across the lot between two opposite angles in some central place, at least once, and in more places, if convenient, and the case may require it. By cross measures, the map may be more correctly drawn, and the divisions should be calculated separately. In such cases, the surveyor will be more likely to ascertain the true contents than he would by surveying only the boundary lines and then calculating the whole together.

NO. VIII.

ON DIVIDING LAND.

As lands are divided into so great a variety of shapes, rules cannot be given which will answer in all cases.

In distributions of estates, the divisions are commonly made with scale and dividers. This method will answer well provided the map is drawn on a large scale, which should not be less than ten rods to an inch.

As more confidence can be placed in arithmetical calculations, it may be recommended to every surveyor to make as little use of the scale and dividers as he can; but in our country, they cannot, in all cases, be dispensed with.

In dividing lands, it will be acknowledged by every experienced surveyor, that it is a difficult matter to make the amount of a considerable number of divisions agree with the whole, when calculated by itself.

A few examples by arithmetical calculation will be given. Let the preceding figure be divided into two equal parts by a line running eastward from the second angle. At what point on the eastern boundary will it terminate?

As you do not know the point, first calculate the area of that part which lies above a line from 2 to 5.

Set the courses and distances of the second, third and fourth courses into their respective columns, having a blank line for the course, distance, latitude, departure, &c. of the closing line from 5 to 2. On the two first of these courses the sum of the northings is 45.07 rods, and that of the eastings is 63.17 rods, and the course from 4 to 5 contains 35.45 rods of southing and 6.25 rods of westing. The southing and westing of the latter being subtracted from the northings and eastings of the two former, leaves a balance of 9.62 rods of southing and 56.92 rods of westing to fill the blank line. The latitude and

departure of the closing line being given, the course may be found by the following proportion.

As the latitude is to radius, so is the departure to the tangent of the course. Look in the column of tangents for the course. The course being found, the distance may be found as follows. As the sine of the course is to the departure, so is radius to the distance. See them worked.

Latitude 9.62, and departure 56.92, given to find the course and distance.

Lat. 9.62	-	-	-	0.983175
: Radius	-	-	-	10.000000
:: Departure 56.92	-	-	-	1.755265
Radius and dep. added	-	-	-	11.755265
Lat. brought down	-	-	-	0.983175
: Tangent of the course 80° 25'	-	-	-	10.772090
Sine of 80° 25'	-	-	-	9.993896
: Departure 56.92	-	-	-	1.755265
:: Radius	-	-	-	10.000000
				11.755265
				9.993896
: Distance	-	57.72	-	1.761369

The course from 5 to 2 is S. 80° 25' W., and the distance is 57.72 rods. This being ascertained, the contents of that part of the figure above this line will be found, eleven acres and thirty-four rods, leaving a deficiency of one acre and a half and thirty-three rods of making one half of the whole figure.

This quantity is to be laid in a triangle on the line from 2 to 5, and on that from 5 to 6, running to a point at 2.

The question is, what distance from 5 towards 6, will be required to give the contents of the triangle? To answer such a question, the area, the contained angle, and one side of the triangle must be given to find the length of the contiguous side, including the angle. Having these data, take the following rule.

To the sine of the given angle, or to its supplement if obtuse, add the logarithm of the given side; subtract radius from this sum, and subtract the remainder from the logarithm of the double area: the last remainder will be the logarithm of the side required. In this case, the angle formed by the line from 5 to 2, and by that from 5 to 6, contains 75° 25', the given

side is 57.72 rods, the area of the triangle is 273 rods, and the double area is 546 rods. See the rule worked.

Sine of $75^{\circ} 25'$	- - -	9.985778
Logarithm of the given side 57.72	- - -	1.761369
Cancel the first figure and R. is	- - -	
subtracted	- - -	1.1747147
Logarithm of the double area	- - -	2.737193
Remainder brought down	- - -	1.747147
Logarithm of the side required 9.77 rods	- -	0.990046

Measure from 5 towards 6, 9 rods and $19\frac{1}{4}$ links to a beech tree, from thence on a straight line to 2, and the figure will be equally divided. The true position of the divisional line being established, the course and distance of it may be calculated as before directed.

The course and distance from 2 to 5 are N. $80^{\circ} 25'$ E., 57.72 rods : from 5 to the beech tree, S. 5° W., 9.77 rods. On the first, 9.62 rods of northing and 56.92 of easting are made. On the second, 9.74 rods of southing and .85 of a rod of westing are made.

The northing of the first course being subtracted from the southing of the second, and the westing of the second from the easting of the first, .12 of a rod of northing and 56.07 rods of westing are given as data by which the course and distance from the beech tree to 2 may be calculated. The course is N. $89^{\circ} 53'$ W., and the distance is 55.07 rods.

Suppose it is next required to lay out 15 rods in width below and parallel with the dividing line.

As the eastern and western boundary lines both turn obliquely from the dividing line, the question is, what distance will be required on each to give the required width?

Make the distance on each boundary line the hypotenuse of a right angled triangle, and 15 rods, the width required, one of the legs or the base. The angle at 2, formed by the boundary and dividing lines, contains $114^{\circ} 53'$. Subtract 90° from this, and $24^{\circ} 53'$ remains, being the angle formed by the given leg (15) and the hypotenuse.

Take the following proportion to find the hypotenuse.

As the co-sine of $24^{\circ} 53'$ is to 15, the given side, so is radius to the distance required. See it worked.

Co-sine of $24^{\circ} 53'$	- - -	9.957687
: given side 15 rods	- - -	1.176091
:: Radius	- - -	10.
	- - -	11.176091
	- - -	9.957687
: side required 16.54 rods	- -	1.218404

The dividing line and the eastern boundary, at the beech tree, form an angle of $85^{\circ} 7'$. Subtract this from 90° and $4^{\circ} 53'$ remains, being the angle by which the east side must be worked.

Co-sine of $4^{\circ} 53'$.	.	.	9.998421
: given side 15 rods	:	.	.	1.176091
: : Radius	.	.	.	10.
				11.176091
				9.998421
				1.177670
: side required 15.05 rods				

The distances required are 15 rods $1\frac{1}{4}$ link on the eastern, and 16 rods $13\frac{1}{2}$ links on the western boundary.

Measure from 2 towards 1, 16 rods $13\frac{1}{2}$ links to a spruce tree, and from the beech tree towards 6, 15 rods $1\frac{1}{4}$ link to a pine tree, and calculate the distance from the pine to the spruce, and the division will be completed. This calculation must be made by a traverse from the courses and distances already known.

From the spruce to 2, N. 25° E. 16.54 rods; from 2 to the beech, S. $89^{\circ} 53'$ E. 56.07 rods; from the beech to the pine S. 5° W. 15.05 rods. Arrange these courses and distances in their proper columns as follows, and calculate the latitude and departure of each, having a blank line for the last.

Courses.	Dist.	N.	S.	E.	W.
N. $25^{\circ} 00'$ E.	16.54	14.99		6.98	
S. $89^{\circ} 53'$ E.	56.07		.12	56.07	
S. $5^{\circ} 00'$ W.	15.05		14.99		1.31
			12		61.74
			15.11	15.11	63.05
					63.05

Having calculated the latitudes and departures, subtract the northing of the first course from the sum of the southings of the two last, and .12 of a rod remains to be entered in the blank column of northings; also, subtract the westing of the third from the sum of the eastings of the two first, and 61.74 remains to fill the blank column of westings. This balance of northing and of westing is the latitude and departure of the line from the pine to the spruce. The distance is

61.74 rods, and the course agrees with that on the opposite side.

Suppose it is next required to lay out four acres adjoining and parallel with the line from the pine to the spruce.

As the figure of this division is not regular, no rule can be given by which it can be calculated by one operation, but it must be done by approximation.

Reduce the quantity of the division to rods, and divide that sum by the length of the known side, and the quotient will be 10.36 rods, but as the south side will be longer than the north, the width cannot be so much.

Assume 10 rods as the width, and calculate the distance on each end by the same process that you did those on the last. The angles in this are the same as in that.

Co-sine of $24^{\circ} 53'$	-	-	-	9.957687
: given side 10 rods	-	-	-	1.000000
:: Radius	-	-	-	10.

				11.000000
				9.957687

: side required 11.03 rods	-	-	-	1.042313
Co-sine of $4^{\circ} 53'$	-	-	-	9.998421
: given side 10 rods	-	-	-	1.000000
:: Radius	-	-	-	10.

				11.000000
				9.998421

: side required 10.04 rods	-	-	-	1.001579

The distances required are 10 rods 1 link on the east, and 11 rods $\frac{3}{4}$ of a link on the west boundary.

Measure from the spruce towards 1, 11 rods $\frac{3}{4}$ of a link to a hemlock, and from the pine towards 6, 10 rods 1 link to a maple, and calculate the distance from the latter tree to the hemlock.

From the hemlock to the spruce N. 25° E. 11.03 rods; from the spruce to the pine, S. $89^{\circ} 53'$ E. 61.74 rods; from the pine to the maple S. 5° W. 10.04 rods.

Courses.	Dist.	N.	S.	E.	W.
N. $25^{\circ} 00'$ E.	11.03	10.00		4.66	
S. $89^{\circ} 53'$ E.	61.74		.12	61.74	
S. $5^{\circ} 00'$ W.	10.04		10.00		.87
			.12		65.53
		10.12	10.12	66.40	66.40

The northing and westing in the blank line is the latitude and departure of the line from the maple to the hemlock. The distance required is 65.53 rods. To this distance, add that of the north side, and the sum of both is 127.27 rods. Multiply half of this sum by 10 rods, the width of the division as it now stands, and the product is 636.3 rods. Subtract this from 640, and 3.7 rods remain, being a deficiency. To this deficiency annex three ciphers, and divide that sum by the distance from the maple to the hemlock, and the quotient will be nearly 6, which is .06 of a rod, or $1\frac{1}{2}$ link. To the quantity already found, add this width on the south side, and the division will be completed.

The south division of the whole figure contains twelve acres, three-quarters and twenty-seven rods. This division now stands in three subdivisions.

The first contains five acres, two quarters and three rods; the second, four acres, and if the foregoing calculations are correct, the third contains three acres, one quarter and twenty-four rods. See the work proved.

There now remains between the southeast corner and the last subdivision, 5.08 rods, and between the southwest corner and the same division, 12.37 rods to be calculated on.

Courses.	Dist.	N.	S.	E.	W.	Merid. Dist.	North Areas.	South Areas.

No. IX.

ON BOUNDS AND ROADS.

As the magnetic needle cannot be relied on in renewing lost boundaries, it is of the first importance that good, substantial bounds be kept up. In divisions, or distributions of lands, surveyors ought to see that such bounds are erected. It is their business to cause them to be made, and such bounds ought to be described in deeds, or in the instruments by which lands are conveyed, and to be a part of the record. By proper care and attention to this part of the business, many disputes may be prevented.

Highways are attended with more difficulties of this kind than the location of the divisions of real estate. In laying highways, it is the common practice to lay the center lines, and order the roads to be of a certain width, and stakes are usually set at the angles. Care is not often taken to set bounds on the sides, and when the roads are made, the centre bounds are destroyed, and the travelling path is often built on one side of the centre ; but as the bounds are lost, it is utterly impossible, after a few years have elapsed, to ascertain by the survey where the road was laid.

Surveyors who are employed on such business ought to describe the angles, or as many as is practicable, in such a manner that the road may afterwards be found.

In taking surveys of roads, the distance on each proprietor's land must be noted for the purpose of assessing damages, but these distances need not be entered in the record. The whole distance on each course must be entered in the record, and it is no matter whether it crosses the land of one or of ten different owners.

The following survey of a road prepared for record, may serve as an example.

Beginning* on the centre of the travelled path of the road leading from H. to M., at a point 4 rods westerly of the bridge near J. T's house, thence running S. 17° E. 84 rods 10 links to a point bearing west 54 links from the south-west point of a large rock ; thence S. 5° E. $77\frac{1}{2}$ rods to a point bearing S. 83° E., distant 77 links from the centre of a large white oak tree ; thence S. $7^{\circ} 30'$ E. 67 rods 20 links to a point bearing west 59 links from a perpendicular crevice in a rock ; thence S. 57 rods 15 links to a pile of stones ; thence S. $11^{\circ} 15'$ E. $137\frac{1}{2}$ rods to a point $7\frac{1}{2}$ rods westerly of the south-west corner of T. B's house, measuring on the range of the front. The line described by the foregoing courses and distances, is the centre of the road which is laid three rods in width.

When the centre line of a road is laid, the distance which it runs on any proprietor's land may be multiplied by the width of the road, and the product will be the quantity of land taken.

Whether the centre or a side of a road is laid, the lines almost uniformly cross the boundary lines of lots of land in such oblique directions, that if a side is laid, it will require too much time to ascertain the exact quantities of land, which will be taken from different proprietors.

Other advantages will be found by laying the centre line of a road, which need not here be mentioned.

DIRECTIONS FOR TAKING MINUTES ON A ROAD.

* The point of the beginning of a road may be described by the intersection of two lines measured from two permanent objects.

NO. X.

ON DISTRIBUTING ESTATES.

As the distribution of estates is connected with surveying, something on that subject, may, with propriety, be added to this work.

Surveyors are agreed that written distributions of real estate are often, and too often returned to Courts, accepted and recorded, which are so unintelligible that it is extremely difficult and sometimes impossible to ascertain with any degree of certainty, where the divisions of land were originally made.

In distributing estates, surveyors have the minutes, and it properly belongs to them to write the distributions.

To young learners who are coming forward to take an active part in this business, some directions may be given.

The divisions of land among heirs in most cases, are first made on paper. When these are completed and agreed to by the distributors, erect the bounds between the several divisions. Next, from the map on which the divisions were made, which will be full of marks and perhaps some blots, copy a neat handsome map on new paper, noting thereon all the courses and distances and all the bounds, which should be entered in the distribution. Also, note in each division of the map the quantity of land it contains, with the name of the heir to whom it was distributed. This map is to be kept by the heirs. Next write the distribution, and before it shall be returned to Court, see that the heirs have a copy of it.

With the map and a copy of the distribution, the heirs will have a record in their own house, from which, at any future period, they may find the divisions of their land.

The following form of a distribution has been approved by experienced Judges* of Probate Courts.

To the Honorable Court of Probate for the District of Rockingham.

The undersigned, distributors of the estate of BENJAMIN BANISTER, Esquire, late of Applebury, within said district, deceased, have distributed said estate, under oath, as follows :

'To PHILURA BANISTER, widow of said deceased, as her right of dower in said estate, fifty acres of land lying on the front of the farm, bounded as follows :—Beginning at the northwest corner of said farm by the highway, thence running east by Roderick Random's land, 50 rods to a maple tree, thence south

* Called Surrogates in some states.

parallel with the highway 160 rods to a hemlock tree by Thomas Trunnion's land, thence west by said Trunnion's land 50 rods to the highway, thence north by said highway 160 rods to the place of beginning. Also the following parts of the dwelling house [describe the parts]. Also, the following parts of the barn [describe the parts and of other buildings].

PERSONAL ESTATE.

Scott's Bible, \$15.	Bed, curtains, &c. \$45.	Look-
		ing glass, \$15.
		\$75.00

To BENJAMIN B. BANISTER, the north division of the farm, containing one hundred acres, being partly encumbered by dower, bounded as follows:—Beginning at the northwest corner of said farm, thence running east by Roderick Random's land 200 rods to a beech tree by Oliver Gulliver's land, thence south by said Gulliver's land, 80 rods to a spruce tree, thence west by land set to Matilda Banister, parallel with said Random's land, 200 rods to a white pine tree by the highway, thence north by said highway, 80 rods to the place of beginning.

Also one undivided half of all the buildings belonging to said estate, being partly encumbered by dower.

Said division of real estate is appraised at	\$2500.00
--	-----------

PERSONAL ESTATE.

One horse \$100.	Two yoke of oxen, \$130.	Ox
wagon, \$50.		
		\$280.00

To MATILDA BANISTER, the south division of the farm, being the remainder and residue of said farm, containing one hundred acres, and is 80 rods in width from front to rear, being partly encumbered by dower, bounded as follows:—North on the division set to Benjamin B. Banister, south on Thomas Trunnion's land, east on Oliver Gulliver's land, west on highway.

Also one undivided half of all the buildings belonging to said estate, subject, in part, to encumbrance.

Said division of real estate is appraised at	\$2500.00
--	-----------

PERSONAL ESTATE.

Bed, curtains, &c. \$45.	Mahogany table, \$12.
Set of silver spoons, \$18.	
	\$70.00

Said widow and said heirs have equal privileges of passing to and from any and every part of the real estate set to each of them in the foregoing distribution, at the usual passways, such as doors, stairs, gates, bars, lanes, paths, &c.

HUGH HUNTER,
CHARLES CHALKER,
CHRISTOPHER CUTLER.

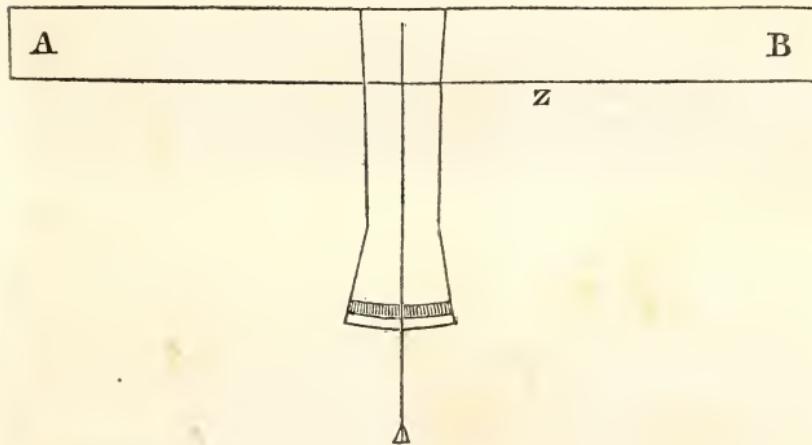

Applebury, July 30th, 1832.

The foregoing caption or preamble is sufficient, as it will appear of record that the distributors were appointed. Forms of distribution must vary according to circumstances.

NO. XI.

ON LEVELLING.

It is not expected that land surveyors will qualify themselves for civil engineers, or that they will furnish themselves with suitable instruments for that business, but every surveyor should furnish himself with an instrument with which he can take levels and angles of elevation* or depression, with a sufficient degree of accuracy to answer in cases of locating roads, of ascertaining whether water may be carried in an aqueduct from one place to another, and to ascertain the fall of mill seats ; also to answer in all common cases. A cheap, simply constructed instrument, represented by the following figure, is recommended.

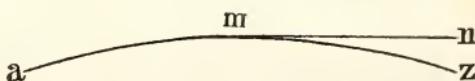

Let AB be a strip of a board three inches wide and three feet in length, or longer if necessary, made perfectly straight on the top. The perpendicular piece which is dovetailed into the top, should be of such a width at the bottom that it may be graduated either way from the centre, ten or fifteen degrees ; and of such a length that the radius by which the graduated arch is swept, should be at least a foot. Great care must be taken in the graduation, to have it done correctly and by fine lines, and to have the centre perpendicular or at right angles

* An angle of elevation rises above a horizontal line ; a depression falls below it.

with the top. The plumb line should be a fine smooth silk thread or a hair. At z, a hole should be bored of a suitable size to set it on the head of a compass staff. Such an instrument, if correctly made, will answer all the purposes before mentioned.*

Before directions are given for levelling, the difference between the *apparent*, and the *true* level, will be explained. The former is a tangent, or a straight line, drawn and continued from any point on the globe, the surface continually departing from it. The latter is the curvature of the earth or a line parallel with it, like two concentric circles, each part of the true level, whatever may be its length, is equidistant from the centre of the earth. The straight line mn, in the following figure, represents the apparent, and the curved line az, the true level.

Let the above described instrument be set on any part of the ocean and be levelled by the plummet, the top being even with the surface of the water, and let a line with the top be continued; as the plummet hangs directly towards the centre of the earth, it is evident that this line is on a tangent, and at the end of one mile it will be 8 inches, at the end of 10 miles 66 feet 4 inches, and at 20 miles, 266 feet above the surface of the water.

In levelling between two points at a considerable distance apart, where the instrument must be often set, as the plummet, like the spokes in a wheel, each time hangs directly towards the centre of the earth, it will keep the top of the instrument on the true level, provided it is set on the centre of each stationary distance. But when the level is taken from the first to the second station, and from the second to the third, and so on in succession to the end, each level will be a tangent; of course the apparent level will be taken.

The surveyor should also be furnished with two observation staves, of suitable width and thickness, eight or ten feet in length, planed smooth, and divided into feet and inches. A narrow strip of red cloth should be wound and tied, or sewed around each of these staves, which may with ease be moved up or down, and should be stopped as the surveyor may direct when taking his observations. Perhaps a shingle, or a piece of board painted red or of some dark color, would be preferable. These staves should be committed to the care of two skilful men, who will be careful to keep them perpendicular.

* This instrument may be improved by fixing sights on the top.

at the stations, and who will be correct in their assistance in taking the observations. Suppose the first stationary distance, on which a level is to be taken, is 20 rods. The staves must be erected at each terminating point, and the surveyor must take his station equidistant from each. If the level strikes the back staff seven feet, and the forward staff two feet above the surface, it is apparent that the rise between the stations is five feet; but the subtraction need not be made, each observation should be entered in its respective column, under the head of fore heights and back heights, or fore sights and back sights, as the surveyor may choose to term them.

When the first observation is completed, the back staff should be carried forward to a convenient place, and the second observation taken as the first. In like manner the rest of the observations must be taken and entered in their respective columns.

If the sum of the back sights shall exceed the fore sights, the terminating point is higher than the place of beginning, but if the sum of the fore sights shall exceed the back sights, then the terminating point is lower than the point of beginning, as will appear by the following examples.

FIRST EXAMPLE.

	<i>Fore sights.</i>	<i>Back sights.</i>
	Feet. Inches.	Feet. Inches.
1st Observation	7 00	0 00
2d "	8 00	2 00
3d "	8 00	1 00
4th "	7 00	2 00
5th "	7 00	2 00
6th "	1 00	7 00
7th "	1 00	8 00
8th "	1 00	8 00
9th "	1 00	8 00
10th "	0 00	8 00
	—	—
	41	46 00
		41 00
		—
	Difference	5 00

The terminating point is 5 feet higher than the point of beginning.

SECOND EXAMPLE.

	<i>Fore sights.</i>	<i>Back sights.</i>
	Feet. Inches.	Feet. Inches.
1st Observation	7 00	0 00
2nd "	8 00	2 00
3d "	8 00	1 00
4th "	7 00	2 00
5th "	7 00	2 00
6th "	1 00	7 00
7th "	1 00	8 00
8th "	1 00	8 00
9th "	1 00	8 00
	—	—
	41 00	38 00
	38 00	

Difference 3 00

The terminating point is 3 feet lower than the point of beginning.

When the sums of the two columns are equal, the extreme points are on the same level. It will not be necessary to enter the stationary distances in the field notes, unless the whole distance between the two extreme points, or a profile of the surface is wanted.

On a distance of 80 rods, the difference between the apparent and true level, is half an inch ; at half a mile, two inches.

In levelling to ascertain how high a dam across a stream may be raised without flowing the meadows, or impeding the wheel of a mill above, great caution should be observed, for if a dam is raised to a level with a point 80 or 100 rods above, to which it may be supposed that water may flow without damage, it will rise higher at that point than any one would suppose, who has not investigated the subject. The rise of water at the head of a pond, will depend in a great measure on the width of it, and on the size and force of the stream.

In locating roads, sometimes it is necessary to ascertain the difference between the elevation of the hills on two routes, both proceeding from one and terminating at the same point. Though the difference of itself, between the rise and fall on two routes, may not in all cases be a correct rule by which to give preference, yet this evidence, with a comparison between the steepness of the hills on two routes, is sufficient.

To perform this service by the slow process of levelling for the conveyance and rise of water, would be attended with an expense which the case would not justify, therefore a more expeditious method will be pointed out. At convenient dis-

tances, take all the angles of elevation and of depression, with the instrument before described, measuring the distance between each station. These angles will be taken more correctly by back sights, as the surveyor can better select proper places for taking them than an inexperienced assistant. The courses or bearings of the several stationary distances, may or may not be taken with a compass.

The elevation of the hills may be ascertained as correctly without the courses as with them. If the courses are taken, it will require more time and expense. Having measured all the stationary distances and taken all the angles of elevation and depression on a route, arrange them, as in the following table. The first column contains the number of stations ; the second, the distances in rods ; the third, the degrees of elevation or depression with the letter E. or D. against them. The column H. D. contains the horizontal distance made on each line. The horizontal distance, with the elevation or depression against it, is the same as the latitude and departure on a course taken by the compass. The column P. H. contains the perpendicular height at the end of each line above the horizontal line. This column in this case, is formed by adding the elevations and by subtracting the depressions.

No.	Dist. rods.			H. D.	E.	D.	P. H.
1	50.	4°	E.	49.88	3.49		3.49
2	40.	5°	E.	39.85	3.49		6.98
3	30.	3°	E.	29.96	1.57		8.55
4	20.	2°	D.	19.99		.70	7.85
5	40.	4°	D.	39.90		2.79	5.06
6	50.	3°	D.	49.93		2.62	2.44
7	45.	1°	E.	44.99	.79		3.23
8	40.	4°	E.	39.90	2.79		6.02
9	50.	3°	E.	49.93	2.62		8.64
10	40.	1°	E.	39.99	.87		9.51
	40.5			15.62	6.11		

By this calculation it appears that the sum of the elevations amount to 15.62 rods or to 257 feet 8 $\frac{3}{4}$ inches, and the depre-

sions amount to 6.11 rods or to 100 feet $9\frac{3}{4}$ inches, which may be thus expressed, 257 feet $8\frac{3}{4}$ inches rise, and 100 feet $9\frac{3}{4}$ inches fall. It also appears that the hill at the terminating point is 24 links or 15 feet 10 inches higher than the top of the first hill.

By this method of taking elevations, they are all above the apparent level, but this will answer the purpose for locating roads.

DIRECTIONS TO MAKE A PROFILE OF THE ABOVE SURVEY.

Lay the plan on a scale of ten rods to an inch. Draw a straight line about $3\frac{1}{2}$ feet in length for a horizontal line. On this line lay down the several horizontal distances as they stand in the table. At the end of each of these distances lay down the perpendicular height which stands against it, at right angles with the horizontal line. From one of these points to another, draw a line from the beginning to the end, which will represent the surface of the ground.

Profiles of roads, or of certain hills on roads, are good evidence to carry into Courts, in disputed cases of this kind. When such testimony is exhibited, the elevations of hills should be given in feet and inches. Also, the rise and fall should be given in this measure.

MISCELLANIES.

TO REDUCE CHAINS AND LINKS TO FEET AND INCHES.

RULE.

Multiply the chains and links, or any number of links less than a chain, by 66, the number of feet in a chain, and from the product point off two figures at the right, for decimals. The figures at the left will be feet. Multiply the decimals by 12, the number of inches in a foot, and point off two figures at the right. Those at the left will be inches. Multiply the last decimals by 4, and point off two figures at the right, and that at the left will be quarters of an inch.

EXAMPLE.

In 2 chains 22 links, how many feet and inches?

$$\begin{array}{r}
 \text{ch. 1.} \\
 2.22 \\
 66 \\
 \hline
 1332 \\
 1332 \\
 \hline
 146.52 \\
 12 \\
 \hline
 164 \\
 52 \\
 \hline
 6.24 \\
 4 \\
 \hline
 .96 \quad \text{Ans. } 146 \text{ ft. } 6\frac{1}{4} \text{ in. nearly.}
 \end{array}$$

TO ASCERTAIN THE NUMBER OF INCHES IN A LINK.

As it will not increase 66 by multiplying it by 1, multiply 66 by 12, and the product will be 7.92 inches.

TO REDUCE INCHES TO THE DECIMAL OF A FOOT.

RULE.

Annex two ciphers to the inches and divide that sum by 12, and the quotient will be the decimal required.

EXAMPLE.

What part of a foot is 9 inches?

$$\begin{array}{r}
 12)900(.75 \\
 84 \\
 \hline
 60 \\
 60 \quad \text{Ans. } .75 \text{ or } \frac{75}{100}
 \end{array}$$

TO REDUCE FEET AND INCHES TO CHAINS AND LINKS.

RULE.

Reduce the inches to the decimal of a foot, and annex that to the feet, or if there are no inches, annex two ciphers to the feet and divide that sum by 66, and the quotient will be chains and links.

EXAMPLE.

In 440 feet 3 inches, how many chains and links ?

$$\begin{array}{r} 66)440.25(6.67 \\ \underline{-} \\ 396 \end{array}$$

442

396

465

462

3 Ans. 6 ch. 67 links.

'TO FIND THE AREA OF AN ELLIPSE OR ELLIPSIS.**RULE.**

Multiply the product of the two diameters by 0.7854, and point off from the product as many figures at the right hand as there are decimals in both factors, and those at the left will be the area of the figure.

EXAMPLE.

What is the area of an ellipse, of which the longest diameter is 65 rods and 10 links, and the shortest is 45 rods and 10 links ?

$$\begin{array}{rccccc} \text{Longest diameter} & - & - & - & 654 \\ \text{Shortest do.} & - & - & - & 454 \\ \hline & & & & \end{array}$$

A. Q. R.

Answer 14 2 12

—

92

When a piece of land is calculated by chains and links, and the contents stand in acres and decimal parts of an acre, it may be multiplied by the price of an acre, and the product will be the amount.

EXAMPLE.

A piece of land 16 chains and 75 links in length, and 12 chains and 25 links in breadth, is sold for \$25 25 per acre, what is the price of it?

Length	:	:	:	16.75
Breadth	:	:	:	12.25
				—
				8375

Answer,				\$518.09.84375

What is the length of a side of a square which contains 6040 acres?

$$\begin{array}{r} 6040 \\ \times 4 \\ \hline 24160 \\ - 40 \\ \hline \end{array}$$

Logarithm of 966400 $\frac{1}{2}5.985157$
2.992578. Answer, 983.06 rods.

What is the length of a side of a square which contains 4 acres or 640 rods?

Logarithm of 640 $\frac{1}{2}2.806180$
1.403090. Answer, 25.3 rods.

A four sided figure, described by the following courses and distances, is divided into two triangles to find arithmetically the contents of each, and the amount of both, viz. A. B. N. 10°

E. 55 rods, B. C. S. 85° E. 65 rods, C. D. S. 8° W. 60 rods, D. A. N. $80^\circ 35'$ W. 66.85 rods. The supplement of the angle contained between the two first sides is 85° , what is the area of the triangle?

Sine of 85°	-	9.998344
A. B. 55 rods	-	1.740363
B. C. 65 do.	-	1.812913

Cancel the first figure 1.3.551620—Double area 3561

$$\begin{array}{r} 160)1780.5(11 \\ \underline{160} \\ 180 \\ \underline{160} \\ 180 \\ \underline{160} \\ \text{A. Q. R.} \\ \text{Answer, } 11 \quad 0 \quad 20\frac{1}{2} \end{array}$$

$$\begin{array}{r} 20.5 \end{array}$$

The angle contained between the two last sides is $88^\circ 35'$, what is the area?

Sine of $88^\circ 35'$	-	9.999867
C. D. 60 rods	-	1.778151
D. A. 66.85 rods	-	1.825101

Cancel the first figure 1.3.603119—Double area 4010

$$\begin{array}{r} 160)2005(12 \\ \underline{160} \\ 405 \\ \text{Answer} \quad - \quad 12 \quad 2 \quad 05 \\ \text{First triangle} \quad \quad \quad 11 \quad 0 \quad 20\frac{1}{2} \\ \hline \hline \end{array}$$

$$\begin{array}{r} 320 \\ 85 \end{array}$$

Whole contents 23 2 25 $\frac{1}{2}$

Perhaps the above is as short and as certain a method to calculate the contents of an oblique angled, four sided figure as can be taken.*

The method of calculating the acres of such figures by multiplying together half the sum of the two opposite sides, is incorrect, or the only certainty there is in it, is that of making in a greater or less degree, an excess of quantity. In cities, it is the practice to measure lots by feet and inches.

To calculate the areas of such lots, reduce the inches to the decimal of a foot, annex such decimals to the feet to which they

* Any polygon may be reduced to triangles, and the contents calculated by the same method.

belong, and calculate as by other measure, which will give the areas in square feet.

When it is required to give the areas of such lots in square rods, and the contents stand in square feet, divide the feet by 272.25, the number of square feet in a rod, and the quotient will be the answer; or the feet and inches given in the distances, may be reduced to chains and links, or to rods and decimal parts of a rod, and the calculations made as in other cases. In measuring city lots, as step-stones and other obstructions may be in the way, extend a rope across the front.—Let it be level, drawn tight, and made fast at each end. Measure on the rope; also, measure the other sides with equal accuracy if necessary.

In the two first editions of this work, a rule was inserted to prove the correctness of the courses in a survey, but it was afterwards discovered by Mr. Flint and by others that the rule will prove courses to be correctly taken when they are incorrect.

The same rule has recently made its appearance in the American Journal of Science and Arts, and it may take a second tour among surveyors under the character of an unerring rule.

FORM OF A FIELD BOOK.

Beginning at a mere-stone at the south-west corner.

Rods. Links.

1. N. $25^{\circ} 00'$ E. 40 00 to a pine tree,
2. N. 10 00 E. 30 00 to a hemlock tree,
3. N. 75 00 E. 60 00 to a spruce tree,
4. S. 10 00 W. 36 00 to a beech tree,
5. S. 5 00 W. 40 00 to a maple tree.
6. S. 85 05 W. 70 12 to the place of beginning.

As great a perplexity as young learners meet with, is that of giving decimals their proper places when calculating latitudes and departures.

What is the latitude and departure of N. 10° E. 6.5 rods?

This need not be taken by two inspections, one for the integer and another for the decimal, but under 10° in the traverse table, against 65, the latitude is 64.01, and the departure is 11.29.

The separating point may be placed between the two first figures in each, and as the fourth figure in the departure is 9, a unit may be added to the third, the fourth figure in each may be omitted, and the latitude is 6.40 rods, and the departure 1.13 rod. What is the latitude and departure of N. 84° E. 70 rods and

2 links? The distance is 70.08 rods. The decimal is $\frac{8}{75}$ of a rod. Over 84° in the traverse table against 70, the latitude is 7.32, and the departure is 69.62. Against 8 over latitude is 0.84, so near a unit that 1 may be added to the second decimal in the latitude, and over departure is 7.96, so near 8 that that number may be added to the second decimal in the departure. The latitude is 7.33, and the departure is 69.70.

On account of the diurnal motion of the magnetic needle, in the warm season of the year, the courses in all surveys, if practicable, should be taken before 9 o'clock in the morning.

Let this matter be investigated. A survey is commenced at seven o'clock in the morning, but is not completed until three o'clock in the afternoon. The course of the first line is N. 5° E., and the distance is 70 rods. The departure on this course and distance is 6.10 rods.

When the survey is completed, the bearing of this line is again taken, and the course is N. $5^\circ 10'$ E. The departure is now 6.30 rods, five links more than it was in the morning. Every compass which is in such order as it ought to be, will generally find in the summer, from morning to one o'clock, as great a change as this, often greater, but seldom less.

The writer knows not who invented the following rules for finding contained angles, but they have been extensively adopted into practice.

N. 62° E. { When the first letters are alike, and the last
N. 44° W. { unlike, add the courses.

S. 72° E. { When the first letters are alike, and the last
S. 25° E. { also, subtract the less course from the greater.

N. 64° E. { When the first letters are unlike and the last
S. 35° E. { alike, add the courses and subtract their sum
from 180° .

N. 57° W. { When the first and the last letters are unlike,
S. 25° E. { subtract the less course from the greater, and
the remainder from 180° .

To find the quantity of an angle, reverse the preceding course, then both courses will run from the same point. These rules are applied only when the first course is reversed.

EXAMPLE.

Two courses are given, viz. S. 62° W. and N. 44° W. to find their contained angle. Suppose yourself standing at the point where these courses meet. Reverse the letters of the first course, and they will stand thus:

N. 62° E. { The first rule.
N. 44° W. {

The following figures were prepared for the sixth edition of this treatise, by Mr. Barnard.* There is nothing in the rules to which they are applied, different in principle from the preceding ones, but they do not require the first course to be reversed.

I. If the first letters are alike, and the last also, add the less course to the supplement of the greater.

II. If the first letters are alike, and the last unlike, subtract the sum of the courses from 180° .

III. If the first letters are unlike and the last alike, add the courses.

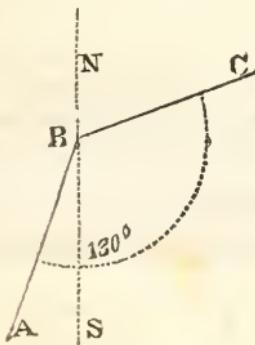

IV. If the first letters are unlike, and the last also, subtract the less course from the greater.

"A set of figures like the following, well fixed in the mind, will be a great assistance to the learner."

RULE 1st.

N. 20° E.

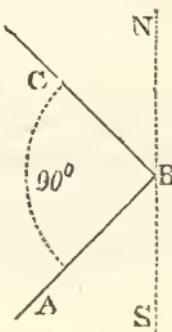

N. 70° E.

RULE 2nd.

N. 50° E.

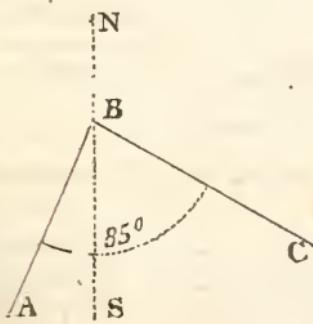

N. 40° W.

RULE 3rd.

N. 25° E.

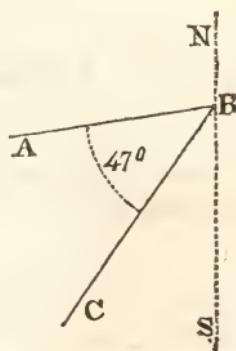

S. 60° E.

RULE 4th.

N. 82° E.

S. 25° W.

"It will be seen that the required angle, in each case, is A. B. C."

* Such notes on the text as are signed Ed. were made by Mr. Barnard.

CONVERGING OF MERIDIANS.

Two meridians cannot be run by the compass parallel to each other, for they will diverge towards the equator and converge towards the pole.

The length of a degree of longitude in any parallel of latitude is to the length of a degree upon the equator, as the co-sine of that latitude is to radius.

The following proportion will give the length of a degree of longitude in any parallel of latitude.

As radius is to the length of a degree on the equator, so is the co-sine of the latitude, to the length of a degree on that latitude. This rule may be applied either to geographical or to statute miles.

A degree on the equator of geographical measure, is 60 miles; that of statute measure has been estimated at $69\frac{1}{2}$ miles, but this estimate is too great.

The earth is considered a sphere, 7930 statute miles in diameter. By the rules contained in this book for calculating the circumference of a circle when the diameter is given, the circumference of the earth will be found 24912.8 miles. This number divided by 360, gives a quotient of 69.2, the length of a degree upon the equator.

FIRST EXAMPLE.

What is the length of a degree of longitude in geographical miles in latitude 42° ?

As radius	-	-	-	-	10.000000
Is to 60 miles	:	:	:	:	1.778151
So is co-sine of latitude 42°	-	-	-	-	9.871073
					11.649224
					10.000000
Answer 44.59 miles.					1.649224

SECOND EXAMPLE.

What is the length of a degree of longitude in statute miles in latitude 42° ?

As radius	-	-	-	-	10.000000
Is to 69.2 miles	:	:	:	:	1.840106
So is co-sine of lat. 42°	-	-	-	-	9.871073
					11.711179
					10.000000
Answer, 51.42 miles.					1.711179

DIVERGENCE OF THE COMPASS FROM PARALLELS OF LATITUDE.

When a meridian crosses a parallel of latitude, the angles on the side opposite to the equator are equal, and each contains less than 90° , of course those on the other side are equal, and each contains more than 90° . This is demonstrated by the meridians and parallels on a globe. The difference between the first and second angles, depends on their distance from the equator. In 70° of latitude, the two first are less, and the two last are greater than they are in 10° of latitude.

When the compass is set on any parallel of latitude, at right angles with a meridian, it is apparent that each angle contains 90° , of course the compass will not run on that parallel, but will diverge from it, and by continual running will arrive at and run on the equator.

In 70° of latitude, the compass tends towards the equator faster than it does in 10° , hence it is evident that an east or west line, run by the compass is not straight, but is curved.

On an extensive plain let a line be run east or west to the distance of some miles ; then from the terminating point, back on the opposite course, the compass will not return on its first track to the place of beginning, but will fall towards the equator.

The divergence of the compass from parallels of latitude, cannot materially affect common land surveying, but lines 10, 20, or 30 miles in length, when designed to be run on particular parallels will be affected by it, unless calculations are made to keep the compass on such parallels.

QUESTIONS.

- At a certain point, I took the elevation of a tower, $3^{\circ} 15'$, then measured toward the tower on an angle of depression $7^{\circ} 333$ feet, to a level with the base of the tower, when I took the elevation again, 8° . Required the height of the tower, and the distance from the second place of observation to the base ; also, how much higher the land was at the place of the first observation, than at the second.

Answer. Height - - - - - 99.6 feet.

Distance required - - - - - 708.6 feet.

Difference in height of land 40.58 feet.

- Two persons made observations on the altitude of a meteor, both being on the same side of it, and in a vertical plane passing through it. The distance between their stations

was 200 rods, and at one the angle of elevation was $36^{\circ} 25'$, at the other $32^{\circ} 50'$, and at the last the disk of the meteor subtended an angle of $5'$. Required the distance from the last place of observation, also the height and diameter of it.

	M.	Q.	R.
Answer. The distance	5	3	60
Height,	3	0	70
Diameter,	45	feet	$5\frac{1}{2}$ inches.

3. From the top of a steeple 165 feet high, the angle of depression of the nearest bank of a river is $11^{\circ} 15'$, that of the opposite bank is $6^{\circ} 15'$. Required the width of the river.

Answer, 41.13 rods.

4. What length of cart tire will it take to band a wheel 5 feet in diameter?

Answer, 15 feet, $8\frac{1}{2}$ inches.

5. A gentleman laid out a garden in a circle, containing one acre, one quarter, and one rod, with a gravelled walk on the outer side of it within the circle, which took up twelve rods of ground. What is the diameter of the circle, and what is the width of the walk?

Answer. The diameter 16 rods—width of the walk 4 feet.

6. Neptune laid out 1,000 square miles of the surface of the sea in a circle, and sold to Aeolus all that part of it which lies without a concentric circle of one third of the diameter. What is the diameter, and how much was sold?

Answer. The diameter 35.68 miles.

The quantity sold 888.92 square miles.

7. A farmer laid out an elliptical orchard, the longest diameter of which was 30 rods, and the shortest was 20 rods, and enclosed the same with a wall two feet thick within the figure. What is the quantity within the wall, and how much is covered by it?

	A.	Q.	R.
Answer. Within the wall	2	3	22
Covered by the wall			9.3

8. From a point in an equilateral triangle, I measured the distances to each corner, and found them 20, 28, and 31 rods. Required the area and the length of the sides.*

	A.	Q.	R.
Answer. The area	5	1	$36\frac{1}{2}$
Length of each side	45	rods.	

* This may be solved geometrically.

9. Required the dimensions of a parallelogram containing one acre and a half, bounded by 64 rods of fence.

Answer, 12 by 20 rods.

10. The area of a parallelogram is five acres one quarter and thirty-five rods, and the diagonal is 43 rods. Required the length of the sides.

Answer, 35 by 25 rods.

11. Required the dimensions of a parallelogram containing twenty-six acres, one quarter, and twenty-four rods, when the length exceeds the breadth by fifty-two rods.

Answer, 44 by 96 rods.

12 Required the dimensions of a parallelogram containing 250 acres, when the sides are in the proportion of 7 to 3.

Answer, 130.93 by $305\frac{1}{2}$ rods.

13. John and Jonathan divided a lot of land equally as to value, which contained 600 acres, and which was appraised at \$2 per acre. John's division was valued at 50 cents per acre more than Jonathan's. What was the contents and price per acre of each division. Answer. John's division contained 263 acres and 12 rods, and the price per acre was $\$2.28\frac{1}{6}$ nearly.

Jonathan's division contained 336 acres, 3 rods, and 28 rods, and the price per acre was $\$1.78\frac{1}{6}$ nearly.

14. The state of Connecticut contains a little more than 4,828 square miles, or 3,090,000 acres, including rivers, harbors, creeks, roads, &c. If this quantity is laid in a square, what will be the length of a side?

A. Q. R.

Answer, 69 1 75.11.

One word of advice to the young surveyor, who is coming forward to be useful in his occupation, will close the appendix.

In the choice of assistants to perform practical operations, never call to your aid *Sir Richard Rum*. He frequently changes his name to *brandy, gin, whiskey, &c.* He is treacherous, and he causes the head to whirl, the body to reel, and the foot to stumble.

By his might, the strong man has fallen, and the promising youth has been brought to an untimely grave.

If you employ *Sir Richard*, your columns of latitude may differ too much for correct work, and your columns of departure may be still worse. You can place no confidence in him, and it is hoped that you will too highly respect your own character to be found in such company.

NOTE.—Such theory as is more *curious* than *useful*, however *correct* it may be, has been excluded from the appendix. The plainest methods have been selected. On some points, the Author has been more minute on account of the fact that many copies of this book are bought by men who do not expect to be surveyors, and who do not place themselves under instructors.

Hebron, (Conn.) August, 1832.

LOGARITHMS.

Let there be a series of numbers, increasing by a common difference, as for instance, by 1, viz.

0, 1, 2, 3, 4, 5, 6, &c.

and another, viz. 1, 10, 100, 1,000, 10,000, 100,000, 1,000,000, &c. increasing by a common multiplier, 10. The former are the LOGARITHMS of the latter.

It will be seen that 1 is added in the upper series, as often as 10 is made a multiplier in the lower. If two logarithms, then, be added, and the numbers below them multiplied, the *sum of the logarithms* will be the *logarithm of the product*.

Thus, if the logs. 1 and 2 be added, and the corresponding numbers, 10 and 100 be multiplied, the sum will be 3, and the product 1,000. These numbers may be seen to correspond to each other, in the two series above; there, 3 stands over 1,000, and is, of course, its logarithm. So, if 2 and 4 be added, and 100 and 10,000 multiplied, the sum will be 6, and the product, 1,000,000, which may be likewise seen above to correspond.

Furthermore, if, from a greater logarithm a less be taken, and, at the same time, the number corresponding to the greater be divided by the number corresponding to the less, the *remainder* will be the *logarithm of the quotient*.

Thus, if from the log. 5, the log. 3 be subtracted, and, at the same time, 100,000, the number corresponding to 5, be divided by 1,000, the number corresponding to 3, the remainder will be 2, and the quotient 100, which may be seen above to correspond to each other.

With a set of logarithms, then, calculated, not merely for the numbers 10, 100, 1000, &c., but for all numbers whatever, it is plain that we might perform the operations of multiplication and division, by addition and subtraction only. Such logarithms are calculated and arranged in tables for use.

By observing the two ranks of numbers at the head of this article, it will be perceived, that the logarithms increase by a constant addition, (of 1,) and the corresponding numbers by a constant multiplication, (by 10,); and therefore, that when the logarithms are in arithmetical progression, the numbers are in geometrical progression. On this account, logarithms have been defined to be a *series of numbers in arithmetical progression, corresponding to another series in geometrical progression*.

But it will be seen that the numbers, 10, 100, 1,000, 10,000, &c. are the first, second, third, fourth, &c. powers of 10, and that their corresponding logarithms, 1, 2, 3, 4, &c. are the indices of these powers. Hence a better definition is,

LOGARITHMS OF NUMBERS ARE THE INDICES, EXPRESSING THE POWERS TO WHICH A GIVEN NUMBER MUST BE RAISED, TO PRODUCE THOSE NUMBERS.

This "given number" is called the RADIX, or BASE, of the system, and may be any number whatever. The number 10, however, is most convenient, and is therefore employed in the common tables.

LOGARITHMS.

The logarithm of 1 is 0, and that of 10 is 1. Hence it is evident, that, for numbers between 1 and 10, the logarithm will be between 0 and 1. Of course, it will be a fraction; and, when placed in the tables, it is expressed by a decimal. For numbers between 10 and 100, the logarithm is between 1 and 2; for numbers from 100 to 1,000, between 2 and 3; from 1,000 to 10,000, between 3 and 4, and so on, consisting, of course, in each case, in part of a whole number, and in part of a decimal. From the above, it will be sufficiently evident, that

THE INTEGRAL (OR WHOLE NUMBER) PART OF ANY LOGARITHM, IS A UNIT LESS THAN THE NUMBER OF INTEGRAL PLACES IN THE CORRESPONDING NUMBER. OR, IT SHOWS HOW FAR THE HIGHEST FIGURE OF THE NUMBER IS DISTANT FROM THE UNIT'S PLACE.

For example,

The log. of	5,799	is	3.763353
	577.9	is	2.763353
	57.99	is	1.763353
	5.799	is	0.763353

THE INTEGRAL PART OF A LOGARITHM IS CALLED THE INDEX, OR CHARACTERISTIC, OF THAT LOGARITHM.

As this characteristic is always a unit less than the number of integral places in the corresponding number, it is evident that when this number has but *one* integral place, the characteristic will be 0; which is the case with the last log. above. If, then, the number be a proper fraction, or a decimal, and have, therefore, *no integral* place, or places, the characteristic of the log. on this principle, ought to be *less than nothing*. Now, since we cannot diminish *nothing*, so as to render it *less than nothing*, we employ, whenever it is necessary to use logarithms of this kind, a characteristic with a mark over it, thus, $\overline{1}$, $\overline{2}$, $\overline{3}$, $\overline{4}$, &c. The mark shows that the characteristic ought to be less than nothing, and the number, over which it is drawn, informs us, *how much* it should be less than nothing. In all cases, then, where it is necessary to *add the logarithm*, we must *subtract this characteristic*; and in all cases where it is necessary to *subtract the logarithm*, we must *add the characteristic*. For, since *adding nothing* to a number does not alter it, adding *less than nothing* ought to *diminish it*. And, since *subtracting nothing* from a number does not alter it, subtracting *less than nothing* ought to *increase it*.*

It will be seen above, that for every division of the number by 10, (or, every removal of its decimal point towards the left) the characteristic becomes a unit less.

* An apology may perhaps be considered necessary for the language here employed. The writer would not be thought to advocate the absurdity that a number may actually be less than nothing; but the phrase is so concise and expressive, and notwithstanding its absurdity, conveys to the mind of one unacquainted with the nature of negative quantities, the idea intended, so much more perfectly, than any explanation we should here have room to make, could do, that it has been thought advisable to employ it. This treatise is intended for practical men, and not for metaphysicians nor scholars. To those who have attended to Algebra, the explanation above will be unnecessary.

Since, then, the log. of 5.799	is	0.763353,
the log. of .5799	will be	$\frac{1}{10}$.763353,
of .05799	"	$\frac{1}{100}$.763353,
of .005799	"	$\frac{1}{1000}$.763353,
of .0005799	"	$\frac{1}{10000}$.763353, &c.

By observing these logarithms, it will be seen, that

THE NEGATIVE CHARACTERISTIC OF A LOGARITHM, SHOWS HOW FAR THE FIRST SIGNIFICANT FIGURE OF ITS CORRESPONDING DECIMAL IS DISTANT FROM THE UNIT'S PLACE.

EXPLANATION OF THE TABLE.

When the logarithms of numbers, from 1 upward to any other given number, are calculated, and arranged in a table, they constitute a table of logarithms. Tables of logarithms of great extent have been calculated, but those in common use extend to numbers no higher than 10,000. This is far enough for the purposes of ordinary calculation.

In the first column on the left of each page, are arranged the natural numbers, and to distinguish this column from the others, the letter N is placed over it. Opposite these numbers in the next ten columns, are arranged the logarithms. For the first 100 numbers, however, on the first page of the table, there is but a single row of logarithms, opposite each column of numbers, and there are four rows of numbers on the page.

TO FIND THE LOGARITHM OF ANY WHOLE NUMBER.

If the number be less than 100, look for it in the column headed N, and directly opposite to it, in the column headed Log. will be found its logarithm.

If the number be greater than 100, but less than 1,000, find it as before, in the column headed N, and directly opposite, in the column headed 0, will be found its logarithm. It will be seen, that when the first two figures of several successive logarithms are alike, they are omitted in the table, after having been once inserted, and only four figures are retained. When, therefore, there are but four figures in the logarithm opposite the given number, cast the eye up the blank till you find two more, which prefix to those already found. It will likewise be observed, that for the logarithms of numbers above 100, no characteristic is inserted in the table. But this may easily be supplied, since it is always a unit less than the integral places in the number. For numbers between 100 and 1,000, then, it is 2.

Find the logarithm of 868. Opposite this number in the table, are found the figures 8520. Casting the eye up the blank we meet with 93, which we prefix to 8520, making 938520. The characteristic, 2, being then prefixed, we have the complete logarithm, 2.938520.

If the number be greater than 1,000, and less than 10,000, find the first three figures in the column, headed N, and the fourth at the head of the page. Then, exactly opposite the first three, and in the column headed by the fourth, will be found the last four figures of the required logarithm. To these must be prefixed two others, found as above, in the column headed 0.

That is, if the logarithm on the same line, in the column headed 0,

LOGARITHMS.

contain six figures, the first two of those must be prefixed. If not, cast the eye up the blank, in search of the proper ones, as before.

There is one exception to this rule. In some logarithms, will be seen points or periods occupying the places of figures. When this is the case, ciphers must be written in place of the points, and *the two figures to be prefixed, must be sought in the next lower line, in the column, headed 0*. Thus,

Find the log. of 4,177. Opposite 417, and in the column headed 7, are found the figures 0864. The opposite log. in the column headed 0 has six figures, of which the first two, viz. 62, are to be prefixed to 0864, making 620864. The characteristic being joined, the log. is 3.620864. For 4,143, we find opposite 414, and under 3, the figures 7315. Here we must look along up the blank in the column, headed 0, for the two figures to be prefixed, which are 61, making the log. 617315, which, with its characteristic, is 3.617315. For 4,366, we find opposite 436, and under 6, the figures . . 84. Here, therefore, we must write ciphers for the periods, thus, 0084, and look in the next lower line of the column headed 0, for the two figures to be prefixed; which are 64, making the log. 640084, which, with its characteristic, is 3.640084.

If the number exceed 10,000, find the logarithm of the first four figures as above. By the remaining figures, multiply the number opposite, in the column headed D; from the right of the product, reject as many figures as the given number has places more than four, and add what is left to the logarithm previously found. This sum will be the log. required.

The column marked D, is a column of differences: that is, it contains the differences between each two successive logarithms. In many cases a mental estimate may be made, of what should be added to a log. without the use of this column.

The logarithms of pure or mixed decimal numbers should be taken out as if for whole numbers, care being taken to prefix the proper characteristic, in each case.

Of vulgar fractions the logs. may be found by reducing them first to decimals, or by the rule given below, in division.

TO FIND THE NUMBER CORRESPONDING TO ANY GIVEN LOGARITHM.

Find the logarithm next less than that given, in the column headed 0; pass the eye to the right, along that horizontal line, into the other columns, and you will find either the log. given, or one very near it; the first three figures of the corresponding number will then be found opposite, in the column headed N, and the fourth figure, directly over the log. at the top of the page. The integral places in this number will be determined by the characteristic of the log. If this characteristic be 3, all the places will be integral; if it be 2, one decimal must be pointed off; if it be 1, two decimals, &c. On the other hand, if it be 4, a cipher must be annexed to the number; if it be 6, two ciphers must be annexed, and so on.

When the given log. cannot be found in the table, however, the number may be more accurately obtained by the following process. Find in the table the next less log., and take the difference between it and the given one. Make this difference the numerator of a fraction, and the number opposite in the column headed D, the denominator; reduce this fraction to a decimal, which write immediately after the four figures corresponding to the tabular log. used. Afterwards place the decimal point where the characteristic of the given log. may require. Thus, find the number corresponding to 2.954921. The next less tabu-

that log. is .954918, and the difference 3. Making this difference the numerator, and 48, the opposite number in the column headed D, the denominator of a fraction, we have $\frac{3}{48}$. This, reduced to a decimal, gives .0625, which, annexed to 9014, the number corresponding to .954918, makes 90140625. Pointing off according to the given characteristic, we have 901.40625, the number required.

Allowance may often be made in the mind, without the trouble of calculation.

MULTIPLICATION BY LOGARITHMS.

From the nature of logarithms, as above explained, the reason of the following rule will be obvious.

TAKE FROM THE TABLE THE LOGARITHMS OF THE NUMBERS TO BE MULTIPLIED, AND ADD THEM TOGETHER. THEIR SUM WILL BE THE LOGARITHM OF THE PRODUCT.

EXAMPLES.

1. Multiply 29.15 by 9.4635.

$$\begin{array}{r} \text{Log. } 29.15 = 1.464639 \\ \text{Log. } 9.4635 = 0.976052 \\ \hline \end{array}$$

$$\text{Product, } 275.86139 + = 2.440691, \text{ sum.}$$

When there are negative characteristics, it is best to *neglect them entirely* in the addition, and afterwards diminish the resulting characteristic by their amount. Thus,

2. Multiply 71.32 by .3205.

$$\begin{array}{r} \text{Log. } 71.32 = 1.853211 \\ \text{Log. } .3205 = 0.505828 \\ \hline \end{array}$$

$$\begin{array}{r} \text{Sum neglecting } - = 2.359039 \\ \text{Log. prod. } 22.858 = 1.359039 \\ \hline \end{array}$$

INVOLUTION BY LOGARITHMS.

A number is involved by multiplying it one or more times into itself. But a number is multiplied by itself, by adding its log. to itself; that is, a number is raised to the second power, by multiplying its log. by 2. In like manner, a number is raised to the third power, by multiplying its log. by 3, and so on. Hence, *to perform involution by logarithms*,

MULTIPLY THE LOGARITHM OF THE NUMBER TO BE INVOLVED, BY THE INDEX OF THE POWER. THE PRODUCT WILL BE THE LOGARITHM OF THE POWER.

EXAMPLES.

1. Involve 2 to the twelfth power.

$$\begin{array}{r} \text{Log. } 2 = 0.301030 \\ \text{Multiply by } 12, \text{ index, } \quad \quad \quad 12 \\ \hline \end{array}$$

$$\text{Power, } 4,096 = 3.612360$$

N

Involve .00003 to the 9th power.

Log. .00003 = $\bar{5}$.477121

Multiply by 9, index, 9

DIVISION BY LOGARITHMS.

To divide one number by another.

SUBTRACT THE LOGARITHM OF THE DIVISOR FROM THAT OF THE DIVIDEND.
THE REMAINDER WILL BE THE LOGARITHM OF THE QUOTIENT.

EXAMPLES.

1. Divide 15,625 by 625.

$$\text{Log. } 15.625 = 4.193820$$

$$\text{Log. } 625 = 2.795880$$

Quotient, 25 = 1.397940

In case the characteristic of the divisor is negative, it must be added instead of being subtracted. Thus,

2. Divide 339 by 0.0807.

Log. 339 = 2.530200

$$\text{Log. } .0807 = \bar{2}.906874$$

Quotient, 4,201.25 nearly = 3.623326

In case the characteristic of the dividend is negative, or is less than that of the divisor, it is best to increase it by a number, which will make it so great, that the divisor may be taken from it. After the process of subtraction, the same number should be taken away from the resulting characteristic. The best number for this purpose is 10, or some even number of tens. Thus,

3. Divide 77 by 111.

Log. 77=1.886491; increased by 10=11.886491
Log. 111= 2.045323

Difference,	9.841168
Quotient, .6937 =	7.841168

This gives us the means of finding the log. of a vulgar fraction; since a fraction merely indicates the division of its numerator by its denominator. The rule seems to be:

TAKE THE LOG. OF THE DENOMINATOR FROM THAT OF THE NUMERATOR.
THE REMAINDER IS THE LOG. OF THE FRACTION.

4. Find the log. of $\frac{2}{4} \frac{5}{7}$.

$$\text{Log. } 25 = 1.397940; \text{ increased by } 10 = 11.397940$$

$$\text{Log. } 47 = 1.672098$$

Log. 46 = 1.672098
Log. 47 =

**Difference,
Logarithm required**

LOGARITHMS.

EVOLUTION BY LOGARITHMS.

As evolution is the opposite of involution, its rule must of course be,

DIVIDE THE LOG. OF THE GIVEN NUMBER, BY THE NUMBER EXPRESSING THE ROOT TO BE FOUND.

EXAMPLE.

Find the 10th root of 59,049.

$$\begin{aligned}\text{Log. } 59,049 &= 4.771213 \\ \text{Divide by } 10 &= 0.477121 \\ \text{Root} &= 3.\end{aligned}$$

In the extraction of roots, logarithms will often be found extremely useful.

PROPORTION BY LOGARITHMS.

ADD TOGETHER THE LOGS. OF THE SECOND AND THIRD TERMS, AND FROM THE SUM SUBTRACT THE LOG. OF THE FIRST. THE REMAINDER WILL BE THE LOG. OF THE FOURTH TERM REQUIRED.

EXAMPLE.

If 23 lbs. of sugar cost \$2.76, what cost 250 lbs.?

Statement. 23 lbs. : 250 lbs. :: \$2.76 . \$ ***

$$\begin{aligned}\text{Log. } 250 &= 2.397940 \\ \text{Log. } 2.76 &= 0.440909\end{aligned}$$

$$\begin{array}{r}\text{Sum}=2.838849 \\ \text{Log. } 23=1.361728\end{array}$$

$$\overline{\overline{\text{Ans. } \$30.00=1.477121}}\quad$$

EXPLANATION OF THE TABLE OF LOGARITHMIC SINES AND TANGENTS.

This table consists merely of logarithms, calculated for the numbers which express the lengths of the natural sines and tangents, to every minute of a quadrant, whose radius is 10,000,000,000. The logarithm of RADIUS, of the sine of 90° , and of the tangent of 45° , will, of course, be 10.000000. As there is frequent necessity to employ the numbers in this table, the following rules must be thoroughly understood.

TO FIND THE LOGARITHMIC SINE, CO-SINE, TANGENT, OR CO-TANGENT, OF ANY NUMBER OF DEGREES, OR DEGREES AND MINUTES.

If the degrees are less than 45, look for them at the top of the page, and for the minutes, in the left hand column; under the given name, and opposite the minutes, will be found the logarithm sought. But, if the degrees are between 45 and 90, look for them at the bottom of the page, and for the minutes, in the right hand column: over the given name, and opposite the minutes, will be found the logarithm sought. If the angle be more than 90° , find the log. for its supplement, and it will be the log. required.

TRAVERSE TABLE.

The secants and co-secants are not often employed in trigonometrical calculations, and are therefore omitted in the annexed table. They may easily be found, if desired, by the following rule.

THE LOGARITHMIC SECANT OF AN ANGLE IS FOUND BY SUBTRACTING THE LOGARITHMIC CO-SINE OF THE SAME ANGLE FROM 20.000000 : and

THE LOGARITHMIC CO-SECANT IS FOUND BY SUBTRACTING THE LOGARITHMIC SINE FROM 20.000000.

Thus, find the secant of $31^{\circ} 20'$. 20.000000
Co-sin. $31^{\circ} 20' = 9.931537$

Rem. = sec. $31^{\circ} 20' = 10.068463$

Find the co-sec. of $47^{\circ} 38'$. 20.000000
Sin. $47^{\circ} 38' = 9.868555$

Rem. = co-sec. $47^{\circ} 38' = 10.131445$

When there are *seconds*, the column headed D is employed. The numbers in this column show how much difference must be allowed in the log. for every second. This difference is carried to two places of decimals. Hence the reason of the following rule.

To find a *sine* or *tangent* to *degrees, minutes, and seconds*.

Find for degrees and minutes as before ; then multiply the opposite number in the column D, by the seconds, cut off two figures from the right of the product, and add what is left to the log. before found. For *co-sines* and *co-tangents*, this product must be *subtracted*, instead of being added.

TO FIND THE DEGREES, OR DEGREES AND MINUTES, ANSWERING TO ANY GIVEN LOGARITHMIC SINE, CO-SINE, TANGENT, OR CO-TANGENT.

Under or over the proper name in the table, seek the given log. or the one nearest to it : the degrees will be found at the same extremity of the page as the name, and the minutes at the left or right, according as the name is at the top or bottom.

To find an angle to seconds, subtract from the given log. the next less in the table, annex two ciphers to the remainder, and divide it, thus augmented, by the tabular difference. The quotient is seconds, to be added to the degrees and minutes of the tabular log. in case of sines and tangents, but to be subtracted, in case of co-sines and co-tangents.

EXPLANATION OF THE TRAVERSE TABLE, OR TABLE OF DIFFERENCE OF LATITUDE AND DEPARTURE.

This is calculated for degrees and quarters of degrees, and for any distance up to 100 rods, chains, &c. ; by which the northings and southings, eastings and westings made in a survey may be found.

NOTE. Northings and southings are called difference of latitude, or simply latitude ; eastings and westings are called departure, meridian distance, or longitude.

To find the latitude and departure, or northing, &c. for any course and distance.

If the course be less than 45° , look for it at the top, but if more than

45° at the bottom of the page, and look for the distance in the right or left hand column ; against the distance, and directly under or over the course, stand the northing, &c. in whole numbers and decimals.

If the course be less than 45° , the northing or southing will be greater than the easting or westing ; but if more than 45° , the easting or westing will be the greatest.

When the distance exceeds 100, take any two or more numbers, which, added together, will equal the distance, and find the latitude and departure for each of these numbers ; add the several latitudes together, and the sum will be the whole latitude ; and so for the departure. And when the distance is in chains and links, or whole numbers and decimals, find the latitude, &c. for the chains or whole numbers, and then for the links and decimals, remembering to remove the decimal point in the table further to the left, according to the given decimal.

1. *Required the latitude and departure for 45 rods, on a course N. $15^\circ 15' W.$*

Under $15^\circ 15'$ and against 45 is 43.42 for the northing, and 11.84 for the westing.

2. *Required the latitude and departure for 120 rods, on a course S. $58^\circ 30' E.$*

Take one third of 120, which is 40; against this number, over $58^\circ 30'$, is 20.90 for the latitude, and 34.11 for the departure. These multiplied by 3 give 62.70 for the southing, and 102.33 for the easting.

3. *Required the latitude and departure for 37.36 rods, or 37 chains and 36 links, on a course N. $26^\circ 45' E.$*

For 37.	Lat. 33.04	Dep. 16.65
0.36	.32	.16
37.36	33.36	16.81

Northing 33.36 Easting 16.81

NOTE—When the minutes are not 15, 30, or 45, the northings, &c. must be calculated by natural sines, or by trigonometry.

When the latitude and departure are themselves given, the course and distance may be found in the table, thus : look along the columns of latitude and departure, until the given numbers are found opposite each other. The course will then be directly under or over them, and the distance in the right or left hand column.

If the numbers cannot be exactly found, take those which come nearest. If either or both are too great to be found in the table, divide both by any number, (10, 100, 1,000, &c. is most convenient,) and use the quotients. The course found thus will be the one required, but the distance must be multiplied by the number used before as a divisor.

EXPLANATION OF THE TABLE OF NATURAL SINES.

Natural Sines are decimals bearing the same proportion to unity or 1, that the sine of the corresponding number of degrees and minutes bears to radius, or sine of 90° . That is, 1 is assumed as the nat. sine of 90° , and the table calculated accordingly.

TO FIND THE NATURAL SINE OF ANY NUMBER OF DEGREES AND MINUTES.

If the degrees be less than 45, look for them at the top of the columns, and for the minutes at the left hand; but if more than 45, look for them at the bottom, and for the minutes at the right hand; under or over the degrees and against the minutes, will be the natural sine required.

The reverse of this will give the degrees and minutes corresponding to any natural sine.

TO CALCULATE THE NORTHING OR SOUTHING, &c. FOR ANY COURSE AND DISTANCE, BY NATURAL SINES.

Find the nat. sine and co-sine of the course, and into each of these multiply the distance; the products will be the latitude and departure required.

Required the latitude and departure for 6 chains and 22 links on a course N. 38° 27' W.

Nat. sine of 38° 27', 0.62183	Nat. co-sine 0.78315

A TABLE
OF
LOGARITHMIC
SINES AND TANGENTS.
FOR EVERY
DEGREE AND MINUTE
OF THE QUADRANT.

N.B. The minutes in the left-hand column of each page, increasing downwards, belong to the degrees at the top ; and those increasing upwards, in the right-hand column, belong to the degrees below.

A TRAVERSE TABLE,

SHOWING THE DIFFERENCE OF

LATITUDE AND DEPARTURE

FOR DISTANCES BETWEEN 1 AND 100, AND FOR ANGLES
TO QUARTER DEGREES BETWEEN 1° AND 90°

TRAVERSE TABLE.

Distance.	$\frac{1}{4}$ Deg.		$\frac{1}{2}$ Deg.		$\frac{3}{4}$ Deg.		Distance.
